Appendix E Soil Boring Logs
Appendix F Compliance Average Area Names

EXECUTIVE SUMMARY

To demonstrate compliance equivalence of the existing soil cover over the M-8 Landfill Site with respect to the Solid Waste Disposal Act of 1965, DPW characterized the near-surface soils using 250 borings installed at strategic locations over the site. DPW performed soil borings and obtained soil samples between November 1998 and June 1999. All soil samples were analyzed for Target Compound List (TCL) Organics + 30 parameters and Target Analyte List (TAL) metals. The data that exceeded the laboratory method detection limit (MDL) and/or the New Jersey Department of Environmental Protection (NJDEP) Residential Direct Contact Soil Cleanup Criteria (RDCSCC) are summarized in table form in this RIR. Where applicable and appropriate, the data were evaluated utilizing the "compliance averaging" approach to determine compliance with NJDEP RDCSCC.

Concentrations of SVOCs, pesticides and PCBs and metals were detected exceeding the NJDEP RDCSCC. In all cases, further analysis of the analytical results did not define a "source area" or level of contamination that necessitated the identification and evaluation of potential remedial actions. In most cases, either the calculated compliance average was below the respective RDCSCC or the exceedence was considered marginal. However, to address the exceedences of analytes that did not meet cleanup criteria in the near surface soils, the DPW will incorporate a document equivalent to a Declaration of Environmental Restriction (DER) into the Fort Monmouth Master Plan for soils at the site. The Army is requesting a ***No Further Action*** determination for these parameters. The DER equivalent may be developed for the entire M-8 Landfill Site or be restricted to specific areas of the site and specific analytes, as identified in this document.

Given the inactive and undisturbed status of the landfill, the continued performance of long-term surface water and groundwater monitoring proximate to the M-8 Landfill Site, the minimal potential for environmental and/or human health impacts, the lack of groundwater uses at or downgradient of the site, and the distribution, occurrence and relatively low concentrations of contaminants of concern (COCs), ***No Further Action*** is recommended for the near-surface soils at the M-8 Landfill Site.

1.0 INTRODUCTION

Versar, Inc. (Versar) has been contracted by the United States (U.S.) Army Fort Monmouth, Directorate of Public Works (DPW), Fort Monmouth, New Jersey to prepare a Remedial Investigation Report (RIR) for the M-8 Landfill Site. The M-8 Landfill Site is located on north of Buildings T-692 and S-697 on the Main Post of Fort Monmouth. This RIR presents a compilation of the results of remedial investigation conducted at the M-8 Landfill Site for near-surface soils, and has been prepared in partial fulfillment of Contract No. DACA 51-00-D-004, Delivery Order No. 0004.

1.1 Objectives

The objective of this RIR is to define shallow soil conditions at the M-8 Landfill Site as proposed in DPW's letter, dated July 7, 1998 and approved by the NJDEP in correspondence dated August 10, 1998 (**Appendix A** and **Appendix B**). The remedial investigation was conducted in accordance with NJDE) Technical Requirements for Site Remediation (July 1999), NJAC 7:26E, et seq.

The remedial investigation and subsequent preparation of the RIR encompassed the following:

- Characterization of shallow subsurface soils through soil sampling and laboratory analysis.
- Comparison of the soil sample analytical results with the NJDEP RDCSC.
- Evaluation of each of the analytes found to exceed the RDCSCC using the compliance averaging approach and discussion of site-specific conditions.

1.2 Report Organization

This report is organized to minimize repetition. The findings of the Roy F. Weston, Inc. (Weston) report entitled, *Site Investigation, Fort Monmouth, New Jersey, Main Post and Charles Wood Areas, Site Investigation Report* (December 1995), were used as the basis for this remedial investigation program. **Section 2.0** provides background information and a general description of the M-8 Landfill Site located at Fort Monmouth. **Section 3.0** describes and summarizes the soil sampling activities conducted at the M-8 Landfill Site. **Section 4.0** presents the soil sample analytical results and compliance analysis**.** The sample collection information, sample results and analyses presented in this RIR were incorporated into a proprietary relational database designed to manage sample data and eliminate errors in cross-referencing information between data tables in this section. Recommendations are presented in **Section 5.0**. References used to prepare this report are listed in **Section 6.0**.

2.0 SITE BACKGROUND AND ENVIRONMENTAL SETTING

The following sections describe the site background and environmental setting of the area surrounding Fort Monmouth and the M-8 Landfill Site. Included is a description of the site location, history, current conditions and environmental setting.

2.1 Site Location and Description

Fort Monmouth is located in the central-eastern portion of New Jersey in Monmouth County, approximately 45 miles south of New York City and 70 miles northeast of Philadelphia (**Figure 2-1**). In addition to the Main Post, the installation includes two subposts, the Charles Wood Area and the Evans Area. The Main Post encompasses approximately 630 acres and is generally bounded by State Highway 35, Parkers Creek, Lafetra Creek, the New Jersey Transit Railroad and a residential area to the south. The post was established in 1918 during World War I (WWI) as an Army Signal Corps training center. The Main Post currently provides administrative, training, and housing support functions, as well as providing many of the community facilities for Fort Monmouth. The primary mission of Fort Monmouth is to provide command, administrative, and logistical support for Headquarters, U.S. Army Communications and Electronics Command (CECOM). CECOM is a major subordinate command of the U.S. Army Materiel Command (AMC) and is the host tenant at Fort Monmouth.

The M-8 Landfill was a former historic fill site located north of Buildings T-692 and S-697 and south of and adjacent to Parkers Creek on the Main Post. The historic fill reportedly contained domestic and industrial wastes. The approximate size of the M-8 Landfill Site area is 315,000 feet^2 (7.2 acres). Based on historical research, the period of operation of the fill site was approximately 1962 to 1981.

2.2 Site Background

The U.S. Army Corps of Engineers (USACE), Baltimore District, initially contracted Roy F. Weston, Inc. (Weston) to perform a field investigation at Fort Monmouth, New Jersey. This investigation was conducted at two separate areas of Fort Monmouth, the Main Post and the Charles Wood areas. Suspected hazardous waste sites were initially identified at Fort Monmouth in a report prepared by the U.S. Army Toxic and Hazardous Materials Agency (USATHAMA, 1980). The USATHAMA report identified 37 sites with known or suspected waste materials on the Main Post and the two subposts (Charles Wood and Evans Area). A background investigation was conducted by Weston of the 37 sites and eight additional sites that were identified by Fort Monmouth and the NJDEP. Weston's findings were described in a report titled, *Investigation of Suspected Hazardous Waste Sites at Fort Monmouth, New Jersey* (1993). In this background report, additional investigations (including sampling and other field work) were recommended at 22 of the sites on the Main Post and Charles Wood areas, including the M-8 Landfill Site. NJDEP approved the recommendations on April 20, 1995. Additional investigations were also

recommended at the Evans Area, and such investigations are being completed under the Base Realignment and Closure (BRAC) program.

The 1995 Weston SI report presents the results of field investigation activities that were performed at 13 sites at the Main Post Area and eight sites at the Charles Wood Area. The results of the investigation of the M-8 Landfill Site are included in the Weston SI report. Initial field investigation activities were performed between November 1994 and March 1995. The field investigation activities included groundwater monitoring well installation and sampling and tidal monitoring. The Weston SI report was used as the basis for the supplemental remedial investigations described in the following sections of this report.

Lithologic data collected from the soil borings indicated that the overburden material consisted of a thin soil cover, approximately 0.4 feet, overlaying fill material consisting of wood, glass and wire fragments intermixed with silty sand and clay.

2.3 Environmental Setting

The following is a description of the geological/hydrogeological setting of the area surrounding the M-8 Landfill Site. Included is a description of the regional geology of the area surrounding Fort Monmouth, as well as descriptions of the local geology and hydrogeology of the Main Post Area.

2.3.1 Regional and Local Geology

Monmouth County lies within the New Jersey Section of the Atlantic Coastal Plain physiographic province. The M-8 Landfill Site is located in what is referred to as the Outer Coastal Plain subprovince, or the Outer Lowlands. The geologic map of New Jersey is provided as **Figure 2-2**.

In general, New Jersey Coastal Plain formations consist of a seaward-dipping wedge of unconsolidated deposits of clay, silt, sand and gravel. These formations typically strike northeast-southwest with a dip ranging from 10 to 60 feet per mile and were deposited on Precambrian and lower Paleozoic rocks (Zapecza, 1989). These sediments, predominantly derived from deltaic, shallow marine and continental shelf environments, date from Cretaceous through the Quaternary Periods. The mineralogy ranges from quartz to glauconite.

The formations record several major transgressive/regressive cycles and contain units, which are generally thicker to the southeast and reflect a deeper water environment. More than 20 regional geologic units are present within the sediments of the Coastal Plain. Regressive, upward coarsening deposits are usually aquifers (e.g., Englishtown and Kirkwood Formations and the Cohansey Sand), while the transgressive deposits act as confining units (e.g., the Merchantville, Marshalltown and Navesink Formations). The individual thickness for these units varies greatly (e.g., from several feet to several hundred feet). The Coastal Plain deposits thicken to the southeast from the Fall Line

(e.g., a boundary zone between older, resistant rocks and younger, softer plain sediments) to greater than 6,500 feet in Cape May County (Brown and Zapecza, 1990).

Based on the regional geologic map (Jablonski, 1968), the Cretaceous age Red Bank and Tinton Sands outcrop at the Main Post area. The Red Bank Sand conformably overlies the Navesink Formation and dips to the southeast at 35 feet per mile. The upper member (Shrewsbury) of the Red Bank Sand is a yellowish-gray to reddish brown clayey, medium-to-coarse-grained sand that contains abundant rock fragments, minor mica and glauconite (Jablonski). The lower member (Sandy Hook) is a dark gray to black, medium-to-fine grained sand with abundant clay, mica and glauconite.

The Tinton Sand conformably overlies the Red Bank Sand and ranges from a clayey medium to very coarse-grained feldspathic-quartz and glauconite-sand to a glauconitic-coarse sand. The color varies from dark yellowish orange or light brown to moderate brown and from light olive to grayish olive. Glauconite may constitute 60 to 80 percent of the sand fraction in the upper part of the unit. The upper part of the Tinton is often highly oxidized and iron oxide encrusted (Minard, 1969). Groundwater occurs beneath the site at a depth of approximately 2 to 12 feet bgs.

The Kirkwood Formation (part of the Kirkwood-Cohansey system) crops out southeast of the Main Post and dips to the southeast at a slope of 20 feet per mile (Jablonski, 1968). The Kirkwood Formation consists of alternating layers of sand and clay. The upper unit is a light gray to yellowish-brown, fine-grained quartz sand with quartz nodules and small pebbles. The lower unit is a brown silt in Monmouth County (Jablonski, 1968).

As presented in the *Site Investigation Report - Main Post and Charles Wood Areas, Fort Monmouth, New Jersey*, prepared by Weston, Inc, December 1995 (Weston SI), several natural and anthropogenic factors contribute to the wide range in concentrations of metals in soils, which further impact the concentration of metals in groundwater. Soils derived from the glauconitic sands contain abundant aluminum, calcium, potassium, iron, magnesium and manganese (among others), which are likely to be present at elevated concentrations in the groundwater, particularly when sediments are entrained in the collected groundwater samples.

As presented in the Weston SI Report (relevant portions presented in **Appendix C**), the lithologic logs from monitoring well installations indicate that the lithology at the M-8 Landfill Site consists of a thin soil cover (0.4 feet) underlain by fill material. The components of the fill materials observed in the borings consist of wood, glass and wire fragments intermixed with silty sand and clay. Groundwater saturation was observed at approximately 2-8 feet below ground surface (bgs) across the site. Water-level elevation data collected during the Weston SI indicates that local groundwater flow is consistently to the north toward Parkers Creek.

2.3.2 Hydrogeology

Fort Monmouth lies in the Atlantic and Eastern Gulf Coastal Plain groundwater region (Meisler et al., 1988). This groundwater region is underlain by undeformed, unconsolidated to semi-consolidated sedimentary deposits. The chemistry of the water near the surface is variable with low dissolved solids and high iron concentrations. The water chemistry in areas underlain by glauconitic sediments (such as Red Bank, Tinton and Hornerstown Sands) is dominated by calcium, magnesium, manganese, aluminum and iron. The sediments in the area of Fort Monmouth were deposited in fluvial-deltaic to near shore environments.

The water table aquifer in the Main Post Area is identified as part of the "Navesink-Hornerstown Confining Units," or minor aquifers. The minor aquifers include the Navesink formation, Red Bank Sand, Tinton Sand, Hornerstown Sand, Vincentown Formation, Manasquan Formation, Shark River Formation, Piney Point Formation and the basal clay of the Kirkwood Formation. These geologic formations comprise a "Composite Confining Bed" for the Wenonah Mount Laurel Aquifer (Zapecza, 1984).

Wells installed in the Red Bank and Tinton Sands produce 2 to 25 gallons per minute (gpm) (Jablonski, 1968). Groundwater is typically encountered at the Main Post and in the surrounding areas at shallow depths below ground surface (2 to 9 feet bgs). Water in the surficial aquifer generally flows east toward the Atlantic Ocean.

Based on a review of the NJDEP GWQS (NJAC 7:9-6), January 7, 1993, Versar has determined that the site is underlain by a Class III-A aquifer. A formal presentation of this finding was made to the NJDEP on April 17, 2001. The primary designated use for Class III-A groundwater is the release or transmittal of groundwater to adjacent classification areas and surface water, as relevant. Secondary designated uses in Class III-A include any reasonable use.

Shallow groundwater may be locally influenced within the Main Post Area by the following factors:

- Tidal influence (based on proximity to the Atlantic Ocean, rivers, and tributaries)
- Topography
- Nature of the fill material within the Main Post area
- Presence of clay and silt lenses in the natural overburden deposits
- Local groundwater recharge areas (i.e., streams, lakes)
- Roadways, utility conduits, and stormwater culverts

Due to the fluvial nature of the overburden deposits (e.g., sand and clay lenses), shallow groundwater flow direction is best determined on a case-by-case basis.

2.3.3 Soils

According to the U.S. Department of Agriculture (USDA), Soil Conservation Service, Monmouth County Soil Survey, the majority of the Main Post is covered by urban land (**Figure 2-3**). The soil survey described urban land as areas where concrete, asphalt, buildings, shopping centers, airports or other impervious surfaces cover 80 percent or more of the surface. In addition, the survey indicated that the natural subsurface soils have largely been replaced with artificial or foreign fill materials (developed land with disturbed soils). The following soil series and classification units are mapped in the Main Post Area:

- DoB Downer sandy loam (with 2 to 5 percent slopes);
- FrB Freehold sandy loam (with 2 to 5 percent slopes);
- FUB Freehold sandy loam/urban land complex (with 0 to 10 percent slopes);
- HV Humaquepts, frequently flooded;
- KvA Kresson loam (with 0 to 5 percent slopes);
- UA Udorthents, smoothed; and
- UD Udorthents – urban land complex (with 0 to 3 percent slopes).

The Downer series soils are well-drained soils that are found on uplands and terraces. The soils are formed in acid, silty coastal plain sediments. The Freehold soils are also well drained and are formed in acid, loamy, coastal plain sediments that, by volume, are one to 10 percent glauconite and are found on uplands. The Humaquepts soils are somewhat poorly- to very poorly-drained soils that are formed in stratified, sandy, or loamy sediments of fluvial origins. The Humaquepts soils are located on the floodplain and are subject to flooding several times each year. The Kresson loam is a nearly level to gently sloping soil and is somewhat poorly drained. The soil is found on low divides and in depressions. The Udorthents soils have been altered by excavation or filling activities. In filled areas, these soils consist of loamy material that is more than 20 inches thick. The filled areas include floodplain, tidal marshes and areas with moderately well drained to very poorly drained soils. Some Udorthent soils contain concrete, asphalt, metal and glass. The soils in the vicinity of the M-12 Landfill Site are classified as UA – Udorthents, smoothed, which may also include old sand and gravel pits that have been smoothed or filled in (Weston, 1995).

2.3.4 Topography and Surface Drainage

Over the last 80 years, the natural topography of Fort Monmouth has been altered by excavation and filling activities conducted by the military. The land surface at the Main Post is relatively flat and ranges in elevation from approximately 4 feet above mean sea level (amsl) in the east at Oceanport Creek to 32 feet amsl at the western end of the post, near Highway 35. The eastern half of the post is generally 10 feet amsl in elevation.

Surface water runoff from the western part of the Main Post flows into the Lafetra Creek to the north or into Mill Creek to the south. The USGS topographic map (**Figure 2-1**) shows the Lafetra Creek as Parkers Creek Branch and Mill Creek as Wampum. Both Mill Creek and Lafetra Creek originate off-post. Mill Creek flows along the southern boundary of the Main Post, turning north just past the Auto Craft Shop. Lafetra Creek forms the northern boundary of the Main Post and joins Mill Creek to form Parkers Creek. Husky Brook flows eastward in the southern part of the Main Post from Husky Brook Lake and into Oceanport Creek. Parkers Creek flows eastward along the northern boundary and joins Oceanport Creek east of the post. Most of Husky Brook, Parkers Creek, Lafetra Creek and Mill Creek are tidally influenced.

The U.S. Fish and Wildlife Service (FWS) National Wetland Inventory Long Branch quadrangle maps indicate the presence of wetlands at the Main Post. Parkers Creek and Oceanport Creek are classified as estuarine intertidal aquatic beds. The area of Parkers Creek and the part of Oceanport Creek/Husky Brook are classified as estuarine intertidal emergent wetlands. Lafetra Creek and Mill Creek are classified as riverine lower perennial open water/unknown bottom.

The M-8 Landfill Site is located on the south side and adjacent to Parkers Creek, which flows eastward into Oceanport Creek. The USGS topographic map (**Figure 2-1**) shows that the land surface of the site is relatively flat at an elevation of less than 20 feet amsl. Surface water runoff from the M-8 Landfill Site is likely to flow northward into Parkers Creek.

3.0 SITE ACTIVITIES

The DPW conducted this remedial investigation in accordance that the NJDEP Technical Requirements for Site Remediation (N.J.A.C. 26:E) to characterize near surface soils and assess potential risks to human health or the environment. The remedial investigation activities consisted of the collection of near-surface soil samples at the M-8 Landfill Site. Remedial investigation activities were performed from November 1998 and continued through June 1999. These activities were managed by the Fort Monmouth DPW and performed by TECOM-Vinnell Services (TVS). The details of remedial investigation activities that occurred at the M-8 Landfill Site are described below.

The DPW characterized the near-surface soils at the M-8 Landfill Site by completing 250 borings (B01-B250) at the site. Samples were collected using a 2-inch Geoprobe® Macrocore sampler. Sampling activities were performed in accordance with the *Fort Monmouth Standard Sampling Operating Procedure* (December 1997). A total of 500 soil samples were collected from the 250 borings and were analyzed for the presence of VOCs, SVOCs, pesticides, PCBs and TAL metals. The soil boring locations were located in and around the M-8 Landfill Site as identified in the Weston SI (1995). The locations of the borings were established in a grid-like pattern within the previously designated boundaries of the M-8 Landfill Site.

Each of the soil samples, except those prepared for VOC analysis, were collected between approximately 0 and 12 inches bgs. VOC samples were taken at approximately 24 inches bgs since surface soils would not be expected to retain volatile constituents over time.

Laboratory analyses of the samples collected at the M-8 Landfill Site were conducted at the Fort Monmouth Environmental Testing Laboratory (FMETL), a New Jersey certified laboratory (Certification No. 13461). The locations of these 250 borings are shown in **Figure 3-1**. A summary of the soil sample collection information and analyses performed is provided in **Table 3-1**. Soil sample laboratory data sheets are provided in **Appendix D**. Soil boring logs are presented in **Appendix E**. Soil analytical results are discussed in **Section 4.0**.

4.0 SOIL SAMPLING RESULTS AND COMPLIANCE ANALYSIS

A summary of the laboratory analytical results for near-surface soils at the M-8 Landfill Site is discussed below. The results were compared with the Cleanup Standards for Contaminated Sites (N.J.A.C. 7:26D), which was revised with Soil Cleanup Criteria dated May 12, 1999. The soil analytical results are presented by analyte (VOCs, SVOCs, Pesticides and PCBs and TAL Metals) and compare the analytical data with the NJDEP RDCSCC. Exceedences of the RDCSCC were subjected to further evaluation involving compliance averaging and site-specific considerations. All of the soil sample results in this report are expressed in milligrams per kilogram (mg/kg), equivalent to parts per million (ppm).

4.1 Soil Analytical Results

The analytical results from the 500 soil samples collected from 250 borings at the M-8 Landfill Site are discussed below, and are included in **Table 4-1**. The soil analytical data is provided in **Appendix D**. The data presented in **Table 4-1** are compared to the RDCSCC. Soil samples from the 250 borings at the M-8 Landfill Site were analyzed for VOCs, SVOCs, pesticides and PCBs and metals. The results that exceeded the respective RDCSCC are shaded in **Table 4-1**.

4.1.1 VOCs

The VOC samples were collected from the M-8 Landfill Site soils at a depth of 24 inches bgs. **Table 4-1** presents the results of laboratory analysis of these analyses. There were no exceedences of the NJDEP RDCSCC for any VOCs at any of the 250 soil borings.

4.1.2 SVOCs

SVOC analyses were conducted on soil samples collected from the 250 soil borings at the M-8 Landfill Site (see **Figure 4-1**). Each of these soil samples was collected at approximately the same depth range, 6-12 inches bgs.

Soil cleanup criteria for SVOCs were exceeded in 50 of the 250 soil boring locations. The borings that presented exceedences of SVOCs are listed in **Table 4-2**. Eleven SVOCs were detected in site soils at concentrations above the RDCSCC. The 11 SVOCs that exceeded the RDCSCC are, with number of exceedences in parentheses, Benzo(a)anthracene (33), Benzo(a)pyrene (47), Benzo(b)fluoranthene (34), Benzo(k)fluoranthene (34), Chrysene (7), Dibenz(a,h)anthracene (10), Fluoranthene (2), Hexachlorobenzene (1), Indeno(1,2,3-cd)pyrene (15), Naphthalene (2) and Pyrene (2). **Table 4-3** presents a summary of the results, identifying the maximum, minimum and average exceedences for each of these parameters. A discussion of these exceedences is presented below.

- Benzo(a)anthracene was detected in 33 of the site soil samples above the RDCSCC of 0.9 mg/kg. The exceedence concentrations ranged from a minimum of 0.92 mg/kg (B69) to a maximum of 2,500 mg/kg (B144). The average exceedence concentration for Benzo(a)anthracene is 139.30 mg/kg.

- Benzo(a)pyrene was detected in 47 site soil samples above the RDCSCC of 0.66 mg/kg. The exceedence concentrations ranged from a minimum of 0.69 mg/kg (B177) to a maximum of 4,500 mg/kg (B144). The average exceedence concentration for Benzo(a)pyrene is 153.0 mg/kg.

- Benzo(b)fluoranthene was detected in 34 of the site soil samples above the RDCSCC of 0.9 mg/kg. The exceedence concentrations ranged from a minimum of 0.93 mg/kg (B22) to a maximum of 5,400 mg/kg (B144). The average exceedence concentration for Benzo(b)fluoranthene exceedences is 236.84 mg/kg.

- Benzo(k)fluoranthene was detected in 34 of the site soil samples above the RDCSCC of 0.9 mg/kg. The exceedence concentrations ranged from a minimum of 0.92 mg/kg (B165) to a maximum of 3,100 mg/kg (B144). The average exceedence concentration for Benzo(k)fluoranthene is 160.35 mg/kg.

- Chrysene was detected in seven site soil samples above the RDCSCC of 9.0 mg/kg. The exceedence concentrations ranged from a minimum of 13.0 mg/kg (B250) to a maximum of 3,800 mg/kg (B144). The average exceedence concentration for Chrysene is 917.71 mg/kg.

- Dibenz(a,h)anthracene was detected in ten of the site soil samples above the RDCSCC of 0.66 mg/kg. The exceedence concentrations ranged from a minimum of 0.82 mg/kg (B63) to a maximum of 850 mg/kg (B144). The average of the Dibenz(a,h)anthracene exceedences is 128.72 mg/kg.

- Fluoranthene was detected in two of the site soil samples above the RDCSCC of 2,300 mg/kg. The exceedence concentrations ranged from a minimum of 4,500 mg/kg (B141) to a maximum of 7,200 mg/kg (B144). The average exceedence concentration for Fluoranthene is 5,850.0 mg/kg.

- Hexachlorobenzene was detected in one site soil sample above the RDCSCC of 0.66 mg/kg at a concentration of 2.0 mg/kg (B204).

- Indeno(1,2,3-cd)pyrene was detected in 15 of the site soil samples above the RDCSCC of 0.9 mg/kg. The exceedence concentrations ranged from a minimum of 1.1 mg/kg (B184) to a maximum of 1,200 mg/kg (B144). The average exceedence concentration for Indeno(1,2,3-cd)pyrene is 129.79 mg/kg.

- Naphthalene was detected in two of the site soil samples above the RDCSCC of 230 mg/kg. The exceedence concentrations ranged from a minimum of 720

mg/kg (B141) to a maximum of 950 mg/kg (B144). The average exceedence concentration for Naphthalene is 835.0 mg/kg.

- Pyrene was detected in two of the site soil samples above the RDCSCC of 1,700 mg/kg. The exceedence concentrations ranged from a minimum of 2,900 mg/kg (B141) to a maximum of 7,400 mg/kg (B144). The average exceedence concentration for Pyrene is 5,150.0 mg/kg.

4.1.3 Pesticides and PCBs

Pesticide and PCB analyses were conducted on soil samples collected from the 250 borings at the M-8 Landfill Site (see **Figure 4-2**). Each of these soil samples was collected at approximately the same depth range, 6-12 inches bgs. Each of the 250 borings was analyzed for 19 pesticides and seven PCB compounds.

Soil cleanup criteria for pesticides were exceeded in ten of the 250 soil boring locations. The borings that presented exceedences of pesticides are listed in **Table 4-2**. Five pesticides were detected in site soils at concentrations above the RDCSCC. The five pesticides that exceeded the RDCSCC are, with number of exceedences in parentheses, 4,4'-DDD (3), 4,4'-DDE (1), 4,4'-DDT (1), Dieldrin (5) and Heptachlor (1). **Table 4-3** presents a summary of the results, identifying the maximum, minimum and average exceedences for each of these parameters. A discussion of these exceedences is presented below.

- 4,4'-DDD was detected in three of the site soil samples above the RDCSCC of 3.0 mg/kg. The exceedence concentrations ranged from a minimum of 3.632 mg/kg (B223) to a maximum of 9.331 mg/kg (B220). The average exceedence concentration for 4,4'-DDD is 5.61 mg/kg.

- 4,4'-DDE was detected in one site soil sample above the RDCSCC of 2.0 mg/kg at a concentration of 2.108 mg/kg (B200).

- 4,4'-DDT was detected in one site soil sample above the RDCSCC of 2.0 mg/kg at a concentration of 3.771 mg/kg (B200).

- Dieldrin was detected in five of the site soil samples above the RDCSCC of 0.042 mg/kg. The exceedence concentrations ranged from a minimum of 0.055 mg/kg (B163) to a maximum of 0.128 mg/kg (B77). The average exceedence concentration for Dieldrin is 0.10 mg/kg.

- Heptachlor was detected in one site soil samples above the RDCSCC of 0.15 mg/kg at a concentration of 1.267 mg/kg (B117).

Soil cleanup criteria for PCBs were exceeded in 13 of the 250 soil boring locations. The borings that presented exceedences of PCBs are listed in **Table 4-2**. Three PCBs were

detected in site soils at concentrations above the RDCSCC. The three PCBs that exceeded the RDCSCC are, with number of exceedences in parentheses, Arochlor 1016 (1), Arochlor 1242 (6) and Arochlor 1260 (6). **Table 4-3** presents a summary of the results, identifying the maximum, minimum and average exceedences for each of these parameters. A discussion of these exceedences is presented below.

- Arochlor 1016 was detected in one site soil sample above the RDCSCC of 0.49 mg/kg at a concentration of 4.763 mg/kg (B64).

- Arochlor 1242 was detected in six of the site soil samples above the RDCSCC of 0.49 mg/kg. The exceedence concentrations ranged from a minimum of 4.634 mg/kg (B158) to a maximum of 5,654.281 mg/kg (B164). The average exceedence concentration for Arochlor 1242 is 958.42 mg/kg.

- Arochlor 1260 was detected in six of the site soil samples above the RDCSCC of 0.49 mg/kg. The exceedence concentrations ranged from a minimum of 0.665 mg/kg (B124) to a maximum of 20.06 mg/kg (B153). The average exceedence concentration for Arochlor 1260 is 4.92 mg/kg.

4.1.4 Metals

The soil samples from the 250 borings (see **Figure 4-3**) were analyzed for 24 TAL metals. The samples were collected from depths of 6-12 inches. A total of 12 metals were detected at concentrations above their respective RDCSCC at 57 of 250 boring locations. The borings that contained exceedences of metals are listed in **Table 4-2**. The 12 metals that exceeded the RDCSCC in the borings are, with the number of exceedences in parentheses, Antimony (17), Arsenic (10), Barium (2), Beryllium (11), Copper (3), Lead (23), Mercury (4), Nickel (1), Selenium (2), Silver (1), Thallium (2) and Zinc (3). **Table 4-3** presents a summary of the results, presenting the maximum, minimum and average exceedences for each of these parameters. A discussion of these exceedences is presented below.

- Antimony was detected in 17 of the site soil samples above the RDCSCC of 14 mg/kg. The exceedence concentrations ranged from a minimum of 14.1 mg/kg (B08) to a maximum of 152 mg/kg (B99). The average exceedence concentration for Antimony is 50.12 mg/kg.

- Arsenic was detected in ten of the site soil samples above the RDCSCC of 20 mg/kg. The exceedence concentrations ranged from a minimum of 20.7 mg/kg (B21U) to a maximum of 9,580 mg/kg (B185). The average exceedence concentration for Arsenic is 996.98 mg/kg.

- Barium was detected in two of the site soil samples above the RDCSCC of 700 mg/kg. The exceedence concentrations ranged from a minimum of 783 mg/kg

(B135) to a maximum of 984 mg/kg (B141). The average exceedence concentration for Barium is 883.50 mg/kg.

- Beryllium was detected in 11 of the site soil samples above the RDCSCC of 2.0 mg/kg. The exceedence concentrations ranged from a minimum of 2.05 mg/kg (B73) to a maximum of 44.6 mg/kg (B185). The average exceedence concentration for Beryllium is 9.90 mg/kg.

- Copper was detected above the RDCSCC of 600 mg/kg in three site soil samples. The exceedence concentrations ranged from a minimum of 692 mg/kg (B146) to a maximum of 1,160 mg/kg (B17). The average exceedence concentration for Copper is 960.67 mg/kg.

- Lead was detected above the RDCSCC of 400 mg/kg in 23 site soil samples. The exceedence concentrations ranged from a minimum of 445 mg/kg (B04) to a maximum of 5,050 mg/kg (B220). The average exceedence concentration for Lead is 1,141.57 mg/kg.

- Mercury was detected above the RDCSCC of 14 mg/kg in four site soil samples. The exceedence concentrations ranged from a minimum of 16.6 mg/kg (B197) to a maximum of 216 mg/kg (B198). The average exceedence concentration for Mercury is 68.17 mg/kg.

- Nickel was detected above the RDCSCC of 250 mg/kg in one site soil sample at a concentration of 7,330 mg/kg (B245).

- Selenium was detected above the RDCSCC of 63 mg/kg in two site soil samples. The exceedence concentrations ranged from a minimum of 87.7 mg/kg (B85) to a maximum of 119 mg/kg (B86). The average exceedence concentration for Selenium is 103.35 mg/kg.

- Silver was detected above the RDCSCC of 110 mg/kg in one site soil sample at a concentration of 124 mg/kg (B40NN).

- Thallium was detected above the RDCSCC of 2.0 mg/kg in two site soil samples. The exceedence concentrations ranged from a minimum of 86.9 mg/kg (B85) to a maximum of 119 mg/kg (B86). The average exceedence concentration for Thallium is 102.95 mg/kg.

- Zinc was detected above the RDCSCC of 1,500 mg/kg in three site soil samples. The exceedence concentrations ranged from a minimum of 1,710 mg/kg (B67) to a maximum of 9,550 mg/kg (B919). The average exceedence concentration for Zinc is 4,493.33 mg/kg.

4.2 Compliance Analysis Method

The first step in determining compliance with the NJDEP Technical Requirements for Site Remediation (7:26E) at the M-8 Landfill Site was to complete the soil sampling analysis. The analytical results from the 500 soil samples collected from 250 borings at the M-8 Landfill Site are discussed above and are included in **Table 4-1**. The method used to determine regulatory compliance is portrayed as a decision tree in **Figure 4-4** and described below.

Figures 4-1, **4-2** and **4-3** present the analytical results for SVOCs, pesticides and PCBs and metals, respectively, by soil boring, for those analytes that exceeded the RDCSCC at one or more locations. There were no exceedences of the RDCSCC for VOCs; therefore, no figures were generated for VOCs. The results for each analyte presented are uniquely colored at each boring location, and results that exceed the respective RDCSCC have been "boxed" in "red." These results are discussed in greater detail in **Section 4.2**. The borings that contained exceedences of the RDCSCC are shown in **Table 4-2**.

For many of the analytical results that exceeded the RDCSCC, the "compliance averaging" approach was then used to determine compliance with NJDEP technical requirements. Compliance averaging uses the average contaminant concentration in an area of concern rather than the contaminant concentration of individual samples for comparison to applicable soil cleanup criteria. The NJDEP policy for compliance averaging is presented in an article entitled, *Compliance Averaging*, from the NJDEP Spring 1995 (Volume 7, No. 2 – Article 08) issue of *Site Remediation News*.

There are several analyte-specific conditions that determine whether compliance averaging can be applied to an exceedence of NJDEP soil cleanup criteria, including maximum analytical results ("ceilings") for individual samples based on the particular NJDEP criterion, as well as specific requirements for arsenic, thallium, beryllium, Benzo(a)pyrene and Dibenz(a,h)anthracene. The compliance analysis method used for the M-8 Landfill Site for each detected analyte that exceeded the respective RDCSCC is summarized in the last column in **Table 4-4**.

Compliance averaging was performed for analytes that met the requirements as summarized in **Figure 4-4**. Compliance average areas were identified within the M-8 Landfill Site based on analyte category (such as VOCs, SVOCs, etc.). The boundaries for these areas of concern were based on areas within that M-8 Landfill Site that presented exceedences of the RDCSCC. Soil borings outside of the areas of concern (referred to as "clean areas" in NJDEP, 1995) presented contaminant concentrations below the RDCSCC and were not included in calculating compliance averages. The boundaries of the compliance average areas are shown in **Figures 4-1** (SVOCs), **4-2** (pesticides and PCBs) and **4-3** (metals). The compliance average area names are shown in **Appendix F**. The compliance average area names are defined according to the analyte category, such as "AREA SVOC-1." When calculating average results, the following rules applied:

1) One-half the MDL was used for non-detect (ND) results.
2) If a sample was diluted, ND results were not used in computing the average.
3) For estimated results (results with "J" qualifiers), the estimated result was used for computing the averages.
4) Compliance averages were calculated as the mean of the results incorporating the ND and estimated results described above.

The compliance averages areas are presented in **Appendix F** and summarized in **Table 4-5**. Compliance averages that were below the NJDEP criteria for a particular analyte justify a recommendation for No Further Action. No Further Action was also justified if a compliance average meets the following conditions for *de minimus* exceedence:

1) Compliance averages met the same analyte-specific conditions that are used for determining whether compliance averaging can be applied,
2) Contaminant concentrations were found within a limited area (for the M-8 Landfill Site, a 15-foot radius, or one-half the grid-spacing, was used for the *de minimus* area determination),
3) Evaluation of contaminant mass, persistence, and location indicated limited potential for significant human health or environmental impacts, and
4) There can only be one *de minimus* exemption per area of concern.

Finally, if an analyte did not meet the *de minimus* conditions, or did not meet the analyte-specific conditions required to perform compliance averaging, additional site-specific parameters were considered as conditions for a No Further Action proposal. If further analysis of the analytical results did not define a "source area" or level of contamination that necessitated the identification and evaluation of potential remedial actions, then the exceedence was considered marginal, or an isolated location and no further action is warranted for the near surface soils. However, to further address the exceedences in the near surface soils, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan for soils at the M-8 Landfill Site presenting the exceedence.

4.3 Compliance Analysis

The Compliance analysis method used to evaluate exceedences of the RDCSCC is presented in **Table 4-4,** and the discussion below is presented for VOCs, SVOCs, pesticides and PCBs and metals and compares the analytical data with the RDCSCC. **Table 4-5** summarizes the compliance averaging results. A summary of the compliance analysis for analytes that exceeded the RDCSCC is provided in **Table 4-6**.

4.3.1 VOCs

There were no exceedences of the NJDEP RDCSCC for soils for any VOCs at any of the 250 soil borings. This finding supports a No Further Action determination relative to VOCs in near-surface soils at the M-8 Landfill Site.

4.3.2 SVOCs

Eleven SVOCs were detected in site soils at concentrations above their respective RDCSCC: Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene, Dibenz(a,h)anthracene, Fluoranthene, Hexachlorobenzene, Indeno(1,2,3-cd)pyrene, Naphthalene and Pyrene. For the purposes of compliance analysis, the sample locations with exceedences of the RDCSCC for SVOCs have been grouped into three areas, AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3. The borings contained within these compliance average areas are labeled in **Figure 4-1** and listed in **Appendix F**. The compliance analysis method for these compounds is presented in **Table 4-4**.

Benzo(a)anthracene (AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3)

Benzo(a)anthracene was detected in 33 of the site soil samples above the RDCSCC of 0.9 mg/kg at concentrations ranging from 0.92 mg/kg to 2,500 mg/kg (average exceedence concentration of 139.30 mg/kg). Because the maximum concentration of Benzo(a)anthracene was greater than the 10X ceiling limit of 9.0 mg/kg in AREA SVOC-2 and AREA SVOC-3, compliance averaging was not appropriate for Benzo(a)anthracene for these areas of the M-8 Landfill Site.

Compliance averaging conducted for Benzo(a)anthracene in AREA SVOC-1 yielded the compliance average concentration of 0.943 mg/kg. Therefore, the compliance average for Benzo(a)anthracene in AREA SVOC-1 is marginally above the RDCSCC of 0.9 mg/kg and is not of concern.

Due to the limited presence of Benzo(a)anthracene in the areas of the site identified as AREA SVOC-2 and AREA SVOC-3 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Benzo(a)anthracene at the M-8 Landfill Site (AREA SVOC-2 and AREA SVOC-3) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Benzo(a)anthracene in near-surface soils at the M-8 Landfill Site.

Benzo(a)pyrene (AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3)

Benzo(a)pyrene was detected in 47 site soil samples above the RDCSCC of 0.66 mg/kg at concentrations ranging from 0.69 mg/kg to 4,500 mg/kg (average exceedence concentration of 153.0 mg/kg). Compliance averaging was not undertaken for Benzo(a)pyrene because, as described in the Spring 1995 *Site Remediation News* (Volume 7, Number 2), NJDEP's guidance regarding the use of multiplication factors (initially applied to RDCSCCs to limit the maximum allowable concentration for individual samples) had changed. NJDEP's current guidance is to apply the multiplication factors to health based criteria, not RDCSCC. The health-based criteria for

Benzo(a)pyrene in soil is 0.09 mg/kg. Applying the 10X factor to 0.09 mg/kg means that no individual sample may exceed 0.9 mg/kg for the purposes of compliance averaging. Therefore, compliance averaging was not appropriate for the M-8 Landfill Site with respect to Benzo(a)pyrene.

Due to the limited presence of Benzo(a)pyrene in the areas of the M-8 Landfill Site identified as AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Benzo(a)pyrene at the M-8 Landfill Site (AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Benzo(a)pyrene in near-surface soils at the M-8 Landfill Site.

Benzo(b)fluoranthene (AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3)

Benzo(b)fluoranthene was detected in 34 of the site soil samples above the RDCSCC of 0.9 mg/kg at concentrations ranging from 0.93 mg/kg to 5,400 mg/kg (average exceedence concentration of 236.84 mg/kg). Because the maximum concentration of Benzo(b)fluoranthene was greater than the 10X ceiling limit of 9 mg/kg in AREA SVOC-2 and AREA SVOC-3, compliance averaging was not appropriate for Benzo(b)fluoranthene for these areas of the M-8 Landfill Site.

Compliance averaging was conducted for Benzo(b)fluoranthene in AREA SVOC-1 and found to be 0.758mg/kg. Therefore, the compliance average for Benzo(b)fluoranthene in AREA SVOC-1 is below the RDCSCC of 0.9 mg/kg and is not of concern.

Due to the limited presence of Benzo(b)fluoranthene in the areaS of the site identified as AREA SVOC-2 and AREA SVOC-3 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Benzo(b)fluoranthene at the M-8 Landfill Site (AREA SVOC-2 and AREA SVOC-3) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Benzo(b)fluoranthene in near-surface soils at the M-8 Landfill Site.

Benzo(k)fluoranthene (AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3)

Benzo(k)fluoranthene was detected in 34 of the site soil samples above the RDCSCC of 0.9 mg/kg at concentrations ranging from 0.92 mg/kg to 3,100 mg/kg (average exceedence concentration of 160.35 mg/kg). Because the maximum concentration of Benzo(k)fluoranthene was greater than the 10X ceiling limit of 9.0 mg/kg in AREA SVOC-2 and AREA SVOC-3, compliance averaging was not appropriate for Benzo(k)fluoranthene for these areas of the M-8 Landfill Site.

Compliance averaging was conducted for Benzo(k)fluoranthene in AREA SVOC-1 and found to be 0.689mg/kg. Therefore, the compliance average for Benzo(k)fluoranthene in AREA SVOC-1 is below the RDCSCC of 0.9 mg/kg and is not of concern.

Due to the limited presence of Benzo(k)fluoranthene in the areas of the site identified as AREA SVOC-2 and AREA SVOC-3 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Benzo(k)fluoranthene at the M-8 Landfill Site (AREA SVOC-2 and AREA SVOC-3) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Benzo(k)fluoranthene in near-surface soils at the M-8 Landfill Site.

Chrysene (AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3)

Chrysene was detected in seven site soil samples above the RDCSCC of 9.0 mg/kg at concentrations of 13.0 mg/kg and 3,800 mg/kg (average exceedence concentration of 917.71 mg/kg). Because the maximum concentration of Chrysene was greater than the 10X ceiling limit of 90 mg/kg in AREA SVOC-2 and AREA SVOC-3, compliance averaging was not appropriate for Chrysene for these areas of the M-8 Landfill Site.

Compliance averaging conducted for Chrysene in AREA SVOC-1 yielded the compliance average concentration of 1.11 mg/kg. Therefore, the compliance average for Chrysene in AREA SVOC-1 is below the RDCSCC of 9.0 mg/kg and is not of concern.

Due to the limited presence of Chrysene in the areas of the site identified as AREA SVOC-2 and AREA SVOC-3 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Chrysene at the M-8 Landfill Site (AREA SVOC-2 and AREA SVOC-3) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Chrysene in near-surface soils at the M-8 Landfill Site.

Dibenz(a,h)anthracene (AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3)

Dibenz(a,h)anthracene was detected in ten of the site soil samples above the RDCSCC of 0.66 mg/kg at concentrations ranging from 0.82 mg/kg to 850 mg/kg (average exceedence concentration of 128.72 mg/kg). Compliance averaging was not undertaken for Dibenz(a,h)anthracene because, as described in the Spring 1995 *Site Remediation News* (Volume 7, Number 2), NJDEP's guidance regarding the use of multiplication factors (initially applied to RDCSCCs to limit the maximum allowable concentration for individual samples) had changed. NJDEP's current guidance is to apply the multiplication factors to health based criteria, not RDCSCC. The health-based criteria for

Dibenz(a,h)anthracene in soil is 0.09 mg/kg. Applying the 10X factor to 0.09 mg/kg means that no individual sample may exceed 0.9 mg/kg for the purposes of compliance averaging. Therefore, compliance averaging was not appropriate for AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3 at the M-8 Landfill Site with respect to Dibenz(a,h)anthracene.

Due to the limited presence of Dibenz(a,h)anthracene in the areas of the M-8 Landfill Site identified as AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Dibenz(a,h)anthracene at the M-8 Landfill Site (AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Dibenz(a,h)anthracene in near-surface soils at the M-8 Landfill Site.

Fluoranthene (AREA SVOC-2)

Fluoranthene was detected in two of the site soil samples above the RDCSCC of 2,300 mg/kg at concentrations ranging from 4,500 mg/kg to 7,200 mg/kg (average exceedence concentration of 5,850.0 mg/kg). Because the maximum concentration of Fluoranthene was greater than the 2X ceiling limit of 4,600 mg/kg in AREA SVOC-2, compliance averaging was not appropriate for Fluoranthene for this area of the M-8 Landfill Site.

Due to the limited presence of Fluoranthene in the area of the site identified as AREA SVOC-2 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Fluoranthene at the M-8 Landfill Site (AREA SVOC-2) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Fluoranthene in near-surface soils at the M-8 Landfill Site.

Hexachlorobenzene (AREA SVOC-1)

Hexachlorobenzene was detected in one site soil sample above the RDCSCC of 0.66 mg/kg at a concentration ranging of 2.0 mg/kg.

Compliance averaging conducted for Hexachlorobenzene in AREA SVOC-1 yielded the compliance average concentration of 0.593 mg/kg. Therefore, the compliance average for Hexachlorobenzene in AREA SVOC-1 is below the RDCSCC of 0.66 mg/kg and is not of concern.

These findings support a No Further Action determination for Hexachlorobenzene in near-surface soils at the M-8 Landfill Site.

Indeno(1,2,3-cd)pyrene (AREA SVOC-1, AREA SVOC-2 and AREA SVOC-3)

Indeno(1,2,3-cd)pyrene was detected in 15 of the site soil samples above the RDCSCC of 0.9 mg/kg at concentrations ranging from 1.1 mg/kg to 1,200 mg/kg (average exceedence concentration of 129.79 mg/kg). Because the maximum concentration of Indeno(1,2,3-cd)pyrene was greater than the 10X ceiling limit of 9.0 mg/kg in AREA SVOC-2 and AREA SVOC-3, compliance averaging was not appropriate for Indeno(1,2,3-cd)pyrene for these areas of the M-8 Landfill Site.

Compliance averaging conducted for Indeno(1,2,3-cd)pyrene in AREA SVOC-1 yielded the compliance average concentration of 0.566 mg/kg. Therefore, the compliance average for Indeno(1,2,3-cd)pyrene in AREA SVOC-1 is below the RDCSCC of 0.9 mg/kg and is not of concern.

Due to the limited presence of Indeno(1,2,3-cd)pyrene in the areas of the site identified as AREA SVOC-2 and AREA SVOC-3 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Indeno(1,2,3-cd)pyrene at the M-8 Landfill Site (AREA SVOC-2 and AREA SVOC-3) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Indeno(1,2,3-cd)pyrene in near-surface soils at the M-8 Landfill Site.

Naphthalene (AREA SVOC-2)

Naphthalene was detected in two of the site soil samples above the RDCSCC of 230 mg/kg at concentrations ranging from 720 mg/kg to 950 mg/kg (average exceedence concentration of 835.0 mg/kg). Because the maximum concentration of Naphthalene was greater than the 2X ceiling limit of 460 mg/kg in AREA SVOC-2, compliance averaging was not appropriate for Naphthalene for this area of the M-8 Landfill Site.

Due to the limited presence of Naphthalene in the area of the site identified as AREA SVOC-2 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Naphthalene at the M-8 Landfill Site (AREA SVOC-2) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Naphthalene in near-surface soils at the M-8 Landfill Site.

Pyrene (AREA SVOC-2)

Pyrene was detected in two of the site soil samples above the RDCSCC of 1,700 mg/kg at concentrations ranging from 2,900 mg/kg to 7,400 mg/kg (average exceedence concentration of 5,150.0 mg/kg). Because the maximum concentration of Pyrene was

greater than the 2X ceiling limit of 3,400 mg/kg in AREA SVOC-2, compliance averaging was not appropriate for Pyrene for this area of the M-8 Landfill Site.

Due to the limited presence of Pyrene in the area of the site identified as AREA SVOC-2 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Pyrene at the M-8 Landfill Site (AREA SVOC-2) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Pyrene in near-surface soils at the M-8 Landfill Site.

4.3.3 Pesticides and PCBs

Five pesticides were detected in site soils at concentrations above their respective RDCSCC: 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, Dieldrin and Heptachlor. For the purposes of compliance analysis, the sample locations with exceedences of the RDCSCC for pesticides have been grouped into three areas, AREA PESTPCB-1, AREA PESTPCB-2 and AREA PESTPCB-3. The borings contained within these compliance average areas are labeled in **Figure 4-2** and listed in **Appendix F**. The compliance analysis method for these compounds is presented in **Table 4-4**.

4,4'-DDD (AREA PESTPCB-1 and AREA PESTPCB-2)

4,4'-DDD was detected in three of the site soil samples above the RDCSCC of 3.0 mg/kg at concentrations ranging from 3.632 mg/kg to 9.331 mg/kg (average exceedence concentration of 5.61 mg/kg).

Compliance averaging for 4,4'-DDD in AREA PESTPCB-1 yielded the compliance average concentration of 0.574 mg/kg. Therefore, the compliance average for 4,4'-DDD in AREA PESTPCB-1 is below the RDCSCC of 3.0 mg/kg and is not of concern.

Compliance averaging for 4,4'-DDD in AREA PESTPCB-2 yielded the compliance average concentration of 0.340 mg/kg. Therefore, the compliance average for 4,4'-DDD in AREA PESTPCB-2 is below the RDCSCC of 3.0 mg/kg and is not of concern.

These findings support a No Further Action determination for 4,4'-DDD in near-surface soils at the M-8 Landfill Site.

4,4'-DDE (AREA PESTPCB-1)

4,4'-DDE was detected in one site soil sample above the RDCSCC of 2.0 mg/kg at a concentration of 2.108 mg/kg.

Compliance averaging for 4,4'-DDE in AREA PESTPCB-1 yielded the compliance average concentration of 0.190 mg/kg. Therefore, the compliance average for 4,4'-DDE in AREA PESTPCB-1 is below the RDCSCC of 2.0 mg/kg and is not of concern.

These findings support a No Further Action determination for 4,4'-DDE in near-surface soils at the M-8 Landfill Site.

4,4'-DDT (AREA PESTPCB-1)

4,4'-DDT was detected in one site soil sample above the RDCSCC of 2.0 mg/kg at a concentration of 3.771 mg/kg.

Compliance averaging for 4,4'-DDT in AREA PESTPCB-1 yielded the compliance average concentration of 0.379 mg/kg. Therefore, the compliance average for 4,4'-DDT in AREA PESTPCB-1 is below the RDCSCC of 2.0 mg/kg and is not of concern.

These findings support a No Further Action determination for 4,4'-DDT in near-surface soils at the M-8 Landfill Site.

Dieldrin (AREA PESTPCB-2 and AREA PESTPCB-3)

Dieldrin was detected in five of the site soil samples above the RDCSCC of 0.042 mg/kg at concentrations ranging from 0.055 mg/kg to 0.128 mg/kg (average exceedence concentration of 0.10 mg/kg).

Compliance averaging for Dieldrin in AREA PESTPCB-2 yielded the compliance average concentration of 0.032 mg/kg. Therefore, the compliance average for Dieldrin in AREA PESTPCB-2 is below the RDCSCC of 0.042 mg/kg and is not of concern.

Compliance averaging for Dieldrin in AREA PESTPCB-3 yielded the compliance average concentration of 0.022 mg/kg. Therefore, the compliance average for Dieldrin in AREA PESTPCB-3 is below the RDCSCC of 0.042 mg/kg and is not of concern.

These findings support a No Further Action determination for Dieldrin in near-surface soils at the M-8 Landfill Site.

Heptachlor (AREA PESTPCB-1)

Heptachlor was detected in one site soil sample above the RDCSCC of 0.15 mg/kg at a concentration of 1.267 mg/kg.

Compliance averaging for Heptachlor in AREA PESTPCB-1 yielded the compliance average concentration of 1.267 mg/kg. Therefore, the compliance average for Heptachlor in AREA PESTPCB-1 is marginally above the RDCSCC of 0.49 mg/kg and is not of concern.

These findings support a No Further Action determination for Heptachlor in near-surface soils at the M-8 Landfill Site.

Three PCBs were detected in site soils at concentrations above their respective RDCSCC: Arochlor 1016, Arochlor 1242 and Arochlor 1260. For the purposes of compliance analysis, the sample locations with exceedences of the RDCSCC for PCBs have been grouped into three areas, AREA PESTPCB-1, AREA PESTPCB-2 and AREA PESTPCB-3. The borings contained within these compliance average areas are labeled in **Figure 4-2** and listed in **Appendix F**. The compliance analysis method for these compounds is presented in **Table 4-4**.

Arochlor 1016 (AREA PESTPCB-2)

Arochlor 1016 was detected in one site soil sample above the RDCSCC of 0.49 mg/kg at a concentration of 4.763 mg/kg.

Compliance averaging for Arochlor 1016 in AREA PESTPCB-2 yielded the compliance average concentration of 0.382 mg/kg. Therefore, the compliance average for Arochlor 1016 in AREA PESTPCB-2 is below the RDCSCC of 0.49 mg/kg and is not of concern.

These findings support a No Further Action determination for Arochlor 1016 in near-surface soils at the M-8 Landfill Site.

Arochlor 1242 (AREA PESTPCB-2 and AREA PESTPCB-3)

Arochlor 1242 was detected in six site soil samples above the RDCSCC of 0.49 mg/kg at concentrations ranging from 4.634 mg/kg to 5,654.281 mg/kg. Because the maximum concentration of Arochlor 1242 was greater than the 10X ceiling limit of 4.9 mg/kg in AREA PESTPCB-2 and AREA PESTPCB-3, compliance averaging was not appropriate for Arochlor 1242 for these areas of the M-8 Landfill Site.

Due to the limited presence of Arochlor 1242 in the areas of the site identified as AREA PESTPCB-2 and AREA PESTPCB-3 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Arochlor 1242 at the M-8 Landfill Site (AREA PESTPCB-2 and AREA PESTPCB-3) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Arochlor 1242 in near-surface soils at the M-8 Landfill Site.

Arochlor 1260 (AREA PESTPCB-1 and AREA PESTPCB-2)

Arochlor 1260 was detected in six of the site soil samples above the RDCSCC of 0.49 mg/kg at concentrations ranging from 0.665 mg/kg to 20.06 mg/kg (average exceedence concentration of 4.92 mg/kg). Because the maximum concentration of Arochlor 1260

was greater than the 10X ceiling limit of 4.9 mg/kg in AREA PESTPCB-2, compliance averaging was not appropriate for Arochlor 1260 for this area of the M-8 Landfill Site.

Compliance averaging for Arochlor 1260 in AREA PESTPCB-1 yielded the compliance average concentration of 1.169 mg/kg. Therefore, the compliance average for Arochlor 1260 in AREA PESTPCB-1 is marginally above the RDCSCC of 0.49 mg/kg and is not of concern.

Due to the limited presence of Arochlor 1260 in the area of the site identified as AREA PESTPCB-2 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Arochlor 1260 at the M-8 Landfill Site (AREA PESTPCB-2) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Arochlor 1260 in near-surface soils at the M-8 Landfill Site.

4.3.4 Metals

Twelve metals were detected at concentrations above their respective RDCSCC: Antimony, Arsenic, Barium, Beryllium, Copper, Lead, Mercury, Nickel, Selenium, Silver, Thallium and Zinc. For the purpose of compliance analysis, the sample locations with exceedences of the RDCSCC for metals have been grouped into one area, AREA METALS-1. The borings contained within these compliance average areas are labeled in **Figure 4-3** and listed in **Appendix F**. The compliance analysis method for these compounds is presented in **Table 4-4**.

Antimony (AREA METALS-1)

Antimony was detected above the RDCSCC of 14 mg/kg in 17 site soil samples at concentrations ranging from 14.1 mg/kg to 152 mg/kg (average exceedence concentration of 50.12 mg/kg). Because the maximum concentration of Antimony was greater than the 5X ceiling limit of 70 mg/kg in AREA METALS-1, compliance averaging was not appropriate for Antimony for this area of the M-8 Landfill Site.

Due to the limited presence of Antimony in the area of the M-8 Landfill Site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Antimony at the M-8 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Antimony in near-surface soils at the M-8 Landfill Site.

Arsenic (AREA METALS-1)

Arsenic was detected in ten of the site soil samples above the RDCSCC of 20 mg/kg at concentrations ranging from 20.7 mg/kg to 9,580 mg/kg (average exceedence concentration of 996.98 mg/kg). Compliance averaging was not undertaken for Arsenic because, as described in the Spring 1995 *Site Remediation News* (Volume 7, Number 2), the 20 mg/kg RDCSCC for arsenic is already 50 times higher than the health based number for Arsenic (0.4 mg/kg). Many of these samples also exceeded the site-specific maximum background concentration for Arsenic in soils (Weston, 1995) of 22.9 mg/kg.

Due to the distribution of Arsenic in the area of the M-8 Landfill Site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Arsenic at the M-8 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Arsenic in near-surface soils at the M-8 Landfill Site.

Barium (AREA METALS-1)

Barium was detected above the RDCSCC of 700 mg/kg in two site soil samples at concentrations ranging from 783 mg/kg to 984 mg/kg (average exceedence concentration of 883.5 mg/kg).

Compliance averaging conducted for Barium in AREA METALS-1 yielded the compliance average concentration of 69.785 mg/kg. Therefore, the compliance average for Barium in AREA METALS-1 is below the RDCSCC of 700 mg/kg and is not of concern.

These findings support a No Further Action determination relative to Barium in near-surface soils at the M-8 Landfill Site.

Beryllium (AREA METALS-1)

Beryllium was detected above the RDCSCC of 2.0 mg/kg in 11 site soil samples at concentrations ranging from 2.05 mg/kg to 44.6 mg/kg (average exceedence concentration of 9.90 mg/kg). Compliance averaging was not undertaken for Beryllium because, as described in the Spring 1995 *Site Remediation News* (Volume 7, Number 2), compliance averaging is not appropriate for soil samples that present Beryllium concentrations that exceed 2.0 mg/kg.

Due to the limited presence of Beryllium in the area of the M-8 Landfill Site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Beryllium at the M-8 Landfill Site (AREA METALS-1) and will be

protective of human health and the environment. The DER equivalent supports a No Further Action determination for Beryllium in near-surface soils at the M-8 Landfill Site.

Copper (AREA METALS-1)

Copper was detected above the RDCSCC of 600 mg/kg in three site soil samples at concentrations ranging from 692 mg/kg to 1,160 mg/kg (average exceedence concentration of 960.67 mg/kg).

Compliance averaging conducted for Copper in AREA METALS-1 yielded the compliance average concentration of 39.995 mg/kg. Therefore, the compliance average for Copper in AREA METALS-1 is below the RDCSCC of 600 mg/kg and is not of concern.

These findings support a No Further Action determination relative to Copper in near-surface soils at the M-8 Landfill Site.

Lead (AREA METALS-1)

Lead was detected above the RDCSCC of 400 mg/kg in 23 site soil samples at concentrations ranging from 445 mg/kg to 5,050 mg/kg (average exceedence concentration of 1,141.57 mg/kg). Because the maximum concentration of Lead was greater than the 2X ceiling limit of 800 mg/kg in AREA METALS-1, compliance averaging was not appropriate for Lead for this area of the M-8 Landfill Site.

Due to the limited presence of Lead in the area of the site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Lead at the M-8 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Lead in near-surface soils at the M-8 Landfill Site.

Mercury (AREA METALS-2)

Mercury was detected above the RDCSCC of 14 mg/kg in four site soil samples at concentrations ranging from 16.6 mg/kg to 216 mg/kg (average exceedence concentration of 68.17 mg/kg). Because the maximum concentration of Mercury was greater than the 5X ceiling limit of 70 mg/kg in AREA METALS-1, compliance averaging was not appropriate for Mercury for this area of the M-8 Landfill Site.

Due to the limited presence of Mercury in the area of the site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting

exceedences of Mercury at the M-8 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Mercury in near-surface soils at the M-8 Landfill Site.

Nickel (AREA METALS-1)

Nickel was detected above the RDCSCC of 250 mg/kg in one site soil sample at a concentration of 7,330 mg/kg. Because the maximum concentration of Nickel was greater than the 2X ceiling limit of 500 mg/kg in AREA METALS-1, compliance averaging was not appropriate for Nickel for this area of the M-8 Landfill Site.

Due to the limited presence of Nickel in the area of the site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Nickel at the M-8 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Nickel in near-surface soils at the M-8 Landfill Site.

Selenium (AREA METALS-1)

Selenium was detected above the RDCSCC of 63 mg/kg in two site soil samples at concentrations ranging from 87.7 mg/kg to 119 mg/kg (average exceedence concentration of 103.35 mg/kg).

Compliance averaging conducted for Selenium in AREA METALS-1 yielded the compliance average concentration of 1.667 mg/kg. Therefore, the compliance average for Selenium in AREA METALS-1 is below the RDCSCC of 63 mg/kg and is not of concern.

These findings support a No Further Action determination relative to Selenium in near-surface soils at the M-8 Landfill Site.

Silver (AREA METALS-1)

Silver was detected above the RDCSCC of 110 mg/kg in one site soil sample at a concentration of 124 mg/kg,

Compliance averaging conducted for Silver in AREA METALS-1 yielded the compliance average concentration of 1.870 mg/kg. Therefore, the compliance average for Silver in AREA METALS-1 is below the RDCSCC of 110 mg/kg and is not of concern.

These findings support a No Further Action determination relative to Silver in near-surface soils at the M-8 Landfill Site.

Thallium (AREA METALS-1)

Thallium was detected above the RDCSCC of 2.0 mg/kg in two site soil samples at concentrations ranging from 86.9 mg/kg to 119 mg/kg (average exceedence concentration of 102.95 mg/kg). Compliance averaging was not undertaken for Thallium because, as described in the Spring 1995 *Site Remediation News* (Volume 7, Number 2), the 2.0 mg/kg RDCSCC for Thallium is already much higher than the health based number for Thallium (0.0 mg/kg).

Due to the limited presence of Thallium in the area of the site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Thallium at the M-8 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Thallium in near-surface soils at the M-8 Landfill Site.

Zinc (AREA METALS-1)

Zinc was detected above the RDCSCC of 1,500 mg/kg in three site soil samples at concentrations ranging from 1,710 mg/kg to 9,550 mg/kg (average exceedence concentration of 4,693.33 mg/kg). Because the maximum concentration of Zinc was greater than the 2X ceiling limit of 3000 mg/kg in AREA METALS-1, compliance averaging was not appropriate for Zinc for this area of the M-8 Landfill Site.

Due to the limited presence of Zinc in the area of the site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Zinc at the M-8 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Zinc in near-surface soils at the M-8 Landfill Site.

5.0 CONCLUSIONS AND RECOMMENDATIONS

To demonstrate compliance equivalence of the existing soil cover over the M-8 Landfill Site with respect to the Solid Waste Disposal Act of 1965, DPW characterized the near-surface soils using 250 borings from strategic locations over the site. DPW installed soil borings and obtained soil samples between November 1998 and June 1999. All soil samples were analyzed for TCL Organics + 30 parameters and TAL metals. The data that exceeded the laboratory MDL and/or the NJDEP RDCSCC are summarized in table form in this RIR. Where applicable and appropriate, the data were evaluated utilizing the "compliance averaging" approach to determine compliance with NJDEP RDCSCC. The conclusions and recommendations of the evaluation of analytical results from the near-surface soils site characterization are provided below.

As discussed in **Section 4.1**, concentrations of SVOCs, pesticides and PCBs and metals were detected exceeding the NJDEP RDCSCC. **Table 4-6** provides a summary of the compliance analysis discussed in this RIR. In all cases, further analysis of the analytical results did not define a "source area" or level of contamination that necessitated the identification and evaluation of potential remedial actions. In most cases, either the calculated compliance average was below the respective RDCSCC or the exceedence was considered marginal (e.g., within 1 to 2 mg/kg of the RDCSCC). However, to address the exceedences of analytes that did not meet cleanup requirements in the near surface soils, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan for soils containing these exceedences. As discussed in **Section 2.3.2.**, the M-8 Landfill Site is located within a Class-III-A aquifer (aquitard) zone, which would minimize the possibility of any contamination migrating offsite. The Army is therefore requesting a ***No Further Action*** for these parameters. The DER equivalent may be developed for the entire M-8 Landfill Site or be restricted to the following areas and analytes (see **Figures 4-1, 4-2** and **4-3** for the boundaries of these areas):

- AREA SVOC-1: Benzo(a)pyrene, and Dibenz(a,h)anthracene
- AREA SVOC-2: Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene, Dibenz(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Naphthalene and Pyrene
- AREA SVOC-3: Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene, Dibenz(a,h)anthracene and Indeno(1,2,3-cd)pyrene
- AREA PESTPCB-2: Arochlor 1242 and Arochlor 1260
- AREA PESTPCB-3: Arochlor 1242
- AREA METALS-1: Antimony, Arsenic, Beryllium, Lead, Mercury, Nickel, Thallium and Zinc

Given the inactive and undisturbed status of the landfill, the performance of long-term surface water and groundwater monitoring proximate to the M-8 Landfill Site, the negligible impacts reported to-date, the lack of groundwater use at or downgradient of the

M-8 Landfill Site and the relatively low levels of COCs in the shallow surface soils across the site, No Further Action is recommended for the near-surface soils at the M-8 Landfill Site.

NOTES:
ND = Not Detected
NLE = No Limit Established
J = Estimated Value: Mass spectrometer and retention time data indicate the presence of the analyte, however the result is less than the method detection limit, but greater than zero.

NOTES:
ND = Not Detected
NLE = No Limit Established
J = Estimated Value: Mass spectrometer and retention time data indicate the presence of the analyte, however the result is less than the method detection limit, but greater than zero.

NOTES:
ND = Not Detected
NLE = No Limit Established
J = Estimated Value: Mass spectrometer and retention time data indicate the presence of the analyte, however the result is less than the method detection limit, but greater than zero.

NOTES:
ND = Not Detected
NLE = No Limit Established
J = Estimated Value: Mass spectrometer and retention time data indicate the presence of the analyte, however the result is less than the method detection limit, but greater than zero.

SUBJECT: Remedial Investigation of Landfill Cover Material

Re: NJDEP Correspondence (Dated April 4, 1996),
Remedial Investigation Report,
Fort Monmouth (Main Post and Charles Wood), NJ

U.S. Army Fort Monmouth
Directorate of Public Works Correspondence (Dated February 24, 1997)
Response to NJDEP Comments, Remedial Investigation Report
Fort Monmouth (Main Post and Charles Wood), NJ

Dear Mr. Curtis:

Based upon our recent discussions regarding ongoing remedial activities at Fort Monmouth, I'm writing this letter to reiterate the Directorate of Public Works (DPW) position regarding the landfill cover material which currently exists at nine former sanitary landfill sites. Eight of the nine landfill sites are located on the Main Post and the remaining site is located in the Charles Wood area. The nine former landfill sites are as follows: M-2, M-3, M-4, M-5, M-8, M-12, M-14, M-18 and CW-3A.

In a letter dated April 4, 1996, under the General Comments Section, Item # 1 - Landfills, you state that all base landfills must comply with NJ Solid Waste Management Act N.J.A.C. 7:26-2A et seq. If Fort Monmouth is able to document that the appropriate solid waste closure procedures were followed, no additional action is required other than the NJDEP approved monitoring. However, if an approved closure was not performed at the landfill, it is recommended that a minimum soil cover of one foot be extended over all areas of documented disposal activities. Also, the approximate boundaries must be established and annotated in the Declaration of Environmental Restriction.

A meeting was held at Fort Monmouth on May 14, 1996 to further discuss various issues of concern as referenced in your April 4, 1996 letter. During the course of the meeting a discussion ensued regarding the existing cover material at each of the closed landfill sites. At said time I stated that the DPW would be unable to document that the nine former landfill sites had been closed in accordance with N.J.A.C. 7:26-2A et seq. It should be noted however that the regulatory statue cited only refers to sanitary landfills operated on or after January 1, 1982. The last sanitary landfill (Site M-8) remaining in operation at Fort Monmouth was closed in October of 1981. Data presented in Table # 1 lists each of the nine landfill sites, approximate acreage and their dates of operation. At the time of closure, each landfill was covered with sufficient soil to properly cap the waste debris which was placed at the site. Cover materials were derived from both onsite and offsite. At present, the thickness of the cover material varies from site to site, but generally is at least one foot in thickness. In accordance with the data presented in Table # 1, the referenced landfills have been closed for a period of between seventeen and forty-two years. During the course of that time, each site has naturally vegetated. The existing vegetation provides both habitat and a food source for a variety of animal species. In addition, the existing vegetation plays a major role in controlling soil erosion. This is particularly important for sites bordering surface water bodies. Each of the former landfill sites are located adjacent to surface water bodies.

At the May 14, 1996 meeting, the DPW proposed to collect surface soil samples from each of the nine landfill sites to document that the existing cover material did not contain contaminant levels above the Residential Direct Contact Soil Cleanup Criteria and/or established background levels. This proposal was offered as an alternative approach to recovering the landfill sites with additional fill materials. Our alternative approach would prevent the destruction of the existing vegetation which in turn would displace numerous animal species and also result in significant soil erosion problems. Based upon your comments at the time of the meeting, you viewed our proposal as a favorable option. In order to move forward with the proposal, you advised us to submit our alternative approach in writing for view and comment. In a letter dated February 24, 1997, this proposal was formally submitted to you. As part of our write up, we specified that soil samples would be collected in accordance with the requirements set forth in N.J.A.C. 7:26E et seq. and the NJDEP Field Sampling Procedures Manual. The DPW would collect a distinct soil sample at thirty foot intervals within the boundaries of the former landfills. The DPW anticipates collecting approximately 1,900 samples not to include trip, field and duplicate samples. Each sample will be analyzed for TCL + 30 parameters and TAL metals.

The DPW has already made a significant investment in terms of buying new equipment and hiring additional laboratory personnel to initiate this project. To date, the DPW has spent $ 775,000.00 to implement the landfill cover study. We anticipate spending an additional $ 475,000.00 in fiscal year 1999 to complete said project. The DPW commenced sampling of the landfill cover material in March of 1998. Our estimated completion date for this project in terms of field sampling activities is April 30, 1999. Currently, the DPW plans on submitting separate Remedial Investigation Reports for each of the nine landfill sites. Numerical data shall be included within each report which accurately measures the thickness of the existing landfill cover material at each sampling location.

The overall purpose of this letter was to restate our position regarding the landfill cover material and to receive written NJDEP endorsement for our alternative approach method. In summary, we feel our approach will identify any potential areas of concern while protecting existing natural resources. Should you have any questions or concerns, the undersigned can be contacted at the following telephone number: (732) 532-6223.

Re: Landfill Remedial Investigation Letter
Fort Monmouth Army Base
Fort Monmouth, Monmouth County

Dear Mr. Fallon:

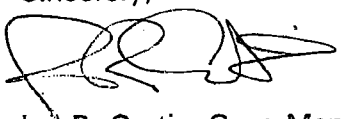
The NJDEP has received your letter of July 7, 1998 regarding the proposed investigation of the eight sanitary landfill sites located on the Main Post and one sanitary landfill located at the Charles Wood area. The NJDEP accepts the letter as submitted and proposed investigation.

Specifically, your letter proposes an investigation of the covers of the subject landfills which is expected to satisfy our concerns noted in our letter of April 4, 1996 and subsequent meeting of May 14, 1996. The information obtained from the investigation should satisfy any remaining questions regarding the landfills and their potential threat to human health and the environment.

In an effort to assure compliance with applicable regulations, I have discussed this case and associated issues with the Sukhdev Bhalla, Chief, Bureau of Landfill Engineering. According to Mr. Bhalla the proposed investigation satisfies New Jersey policy and procedure, as well as the Solid Waste Management Act. (N.J.A.C. 7:26-2A et seq.) requirements.

I look forward to the reviewing the subject report. If I can be of any further assistance, please do not hesitate to contact me at (609) 633-7232.

Sincerely,



Ian R. Curtis, Case Manager

APPENDIX C

Roy F. Weston, Inc. Site Investigation Report, December 1995
Section 4.2.7 – Landfill 8 (M-8)

4.2.7 Landfill 8 (M-8)

4.2.7.1 Site Location

Landfill 8 (M-8) is located north of Buildings T-692 and S-697 in a bend of Parkers Creek (Figure 4.2-12). According to the *Phase I Engineering Study and Compliance Plan, Fort Monmouth Solid Waste Landfill* (Cosulich, 1981), a masonry dike was constructed around the landfill perimeter adjacent to Parkers Creek. The area within the dike is 9.5 acres, of which approximately 7.2 acres contain waste material. The approximate area of site M-8 is 315,000 ft^2 (7.2 acres).

4.2.7.2 Site History

Landfill 8 was operated from 1962 through 1981. In preparation for landfill operations, as mentioned previously, a masonry dike was constructed around the perimeter. According to Cosulich (1981), in the southern part of the landfill area, an approximately 0.9-acre area was excavated to 12 feet below grade prior to filling with solid waste. Waste material was deposited directly on the existing surface over the rest of the site. Cosulich found the bottom of fill to be 3 feet below sea level. The 1969 aerial photographs show an uneven surface with both pit-type disposal and piled-up debris. A number of drums stacked near the entrance just west of the STP are visible in the 1969 photos. The area just west of the stacked drums appears to have randomly strewn drums. In the western half of the site, there were two separate piles of telephone poles. One area in the south-central part of the landfill was used for the disposal of trees and brush.

The photos also show that soil was used to cover the trash. In 1969 part of the area was covered with vegetation.

At present, the landfill is covered with heavy brush and small trees. There is no visible evidence of the drums observed in the 1969 aerial photographs. Four monitor wells and several piezometers of unknown construction were found during the site walkover in 1993.

According to the IA in 1979, materials observed in Landfill 8 and determined from interviews, included unwashed pesticide/herbicide cans, batteries, fluorescent tubes, electronic components, garbage, asbestos wrappings from pipes, soot and boiler scale, sludge from STPs, small quantities of outdated drugs, outdated photographic chemicals in glass bottles, building rubble (including ACM), incinerator ash, sand from oil spill cleanups, and other debris. Cosulich reported that incinerator ash from the classified document incinerator (site M-7) ranging in thickness from 2.5 to 6.5 feet was found along the southern boundary of the landfill. Cosulich also reports that leaves and brush were placed in this landfill. From 1992 through the present, an adjacent area to the southeast of Landfill M-8 has been used for a leaf-composting operation. This operation has an NJDEP permit.

As part of an NJPDES permit, surface-water samples have been taken at two locations in Lafetra Creek since February 1986. The results are summarized in the recent report (WESTON, 1993). No compounds were detected in concentrations above the NJDEP surface-water criteria.

4.2.7.3 Sampling Effort

Because of the poor recovery of the original Landfill 8 monitor wells and the highly turbid conditions in the wells, all existing wells and piezometers were abandoned. Four new monitor wells (MW-12 through MW-15), shown in Figure 4.2-12, were installed and sampled twice for TCL +30 parameters, TAL metals, sulfate, ammonia, and cyanide in an effort to evaluate the impacts of previous site activities on groundwater quality. The new wells were surveyed and tidal water-elevation monitoring was conducted in the four new monitor wells and at stilling well-7 (Figure 4.2-12).

4.2.7.4 Hydrogeologic Interpretation

Lithologic logs from downgradient wells MW-13, MW-14, and MW-15 indicate that the lithology consists of a thin soil cover (0.4 ft) underlain by fill material. The components of the filled materials observed in the borings consisted of large wood chip fragments, amber glass chips, and traces of wires. Natural sandy silt with trace amounts of clay were intermixed with the manmade

materials. Monitor well MW-12, located upgradient of the landfill boundary, indicates a lithology consisting of an orange-brown medium-fine-grained sand with trace amounts of silt and clay.

Groundwater saturation observed during drilling operations ranged from 2 to 8 ft bgs, depending on the proximity to Parkers Creek. Monitor wells were screened across the water table and were drilled to 15 ft bgs at all well locations. Water-level elevation data, measured on 6 March 1995, indicate that local groundwater flow is generally north toward Parkers Creek (Figure 4.2-13). Based on groundwater elevation measurements, monitor wells MW-13, MW-14, and MW-15 are downgradient and MW-12 is upgradient of the area under investigation.

4.2.7.5 Groundwater Sampling Results

Monitor wells at site M-8 were sampled for the analytical parameters listed in Table 3.8-1. The analytical results for groundwater samples from the individual sampling rounds are listed in Appendix D. Table 4.2-9 compares the average concentrations of the detected compounds from the February and March sampling rounds with the NJDEP GWQC, and then compares the results with the subsequent site-specific and Monmouth County maximum background concentrations, where appropriate. Figure 4.2-14 presents the locations and average concentrations of compounds detected above the NJDEP GWQC and established maximum background at the Main Post.

VOCs

Three VOCs (tetrachloroethene, benzene, and chlorobenzene) were detected in site groundwater in one or both sampling rounds in concentrations exceeding the NJDEP GWQC. Tetrachloroethene was detected in MW-12, the upgradient well, from both sampling rounds. Benzene was detected below the laboratory quantitation limit in MW-15 from both sampling rounds; however, the level is estimated to be above the NJDEP GWQC of 1 µg/L. Chlorobenzene was detected in MW-15 from both sampling rounds and in MW-14 below laboratory quantitation limits, from the March sampling round only. VOC compounds were not detected in MW-13.

Table 4.2-9
Fort Monmouth - Main Post
Summary of Average Concentrations of Detected Compounds in Groundwater - Site M-8

[1] - same compound as listed by NJDEP tetrachloroethylene

Compounds exceeding NJDEP groundwater quality criteria are noted by bold numbers.

NJDEP groundwater quality criteria consist of the higher number between the PQL or STANDARD

*PQL - Practical Quantitation Limit -was used as the NJDEP groundwater quality criteria

NLE - No Level Established

ND - Indicates that the compound was not detected at the noted quantification limit

J - Indicates that the concentration value was estimated due to detection at or near the quantification limits

** - Method detection limit exceeds NJDEP groundwater quality criteria.

NA - Not Analyzed

[2] - Monmouth County maximum background concentrations.

SVOCs

One SVOC (acenaphthene) was detected above the laboratory quantitation limit in monitor well MW-15. Acenaphthene was detected in a concentration well below the NJDEP GWQC.

Pesticides/PCBs

Pesticides/PCBs were not detected in the site monitor wells from either sampling round.

Metals

As indicated in Table 4.2-9, of the 19 metals detected in site groundwater, 4 metals (aluminum, iron, manganese, and sodium) were found in concentrations exceeding the NJDEP GWQC. However, aluminum was found in concentrations below those determined for site-specific and Monmouth County maximum background levels. Although iron was found in concentrations well below site-specific maximum background levels, iron was detected in concentrations in MW-13 and MW-14 above Monmouth County maximum background levels. The presence of iron in exceedance of the criteria may be attributable to the high concentrations found in site background soils and is not a compound of concern. Manganese in MW-13 and sodium in MW-14 and MW-15 were detected in concentrations greater than both established background levels (Figure 4.2-14). Elevated sodium concentrations may be the result of saline water intrusion into the groundwater. These wells are near the Parkers Creek estuary. Saltwater has invaded the estuary (see Subsection 4.2.7.6.1) and intruded the aquifer monitored by these wells. Sodium is not a compound of concern. As discussed in Subsection 4.1, groundwater flowing through glauconitic formations contains abundant manganese. In addition, manganese is a common metal found in tidally influenced environments. Therefore, manganese is not identified as a compound of concern.

Cyanide, Sulfate, and Ammonia

Cyanide, sulfate, and ammonia as nitrogen were analyzed for in site M-8 groundwater. Cyanide was not detected in the site monitor wells from either sampling round. Sulfate was detected above the laboratory quantitation limit in both sampling rounds in MW-12, MW-13, MW-14, and MW-15. Ammonia as nitrogen was detected above the laboratory quantitation limit in both sampling rounds in MW-13 and MW-15. Ammonia, not detected from the February sampling round in MW-14, was detected in the March sampling round. Sulfate and ammonia were detected well below the NJDEP GWQC.

4.2.7.6 Tidal Monitoring

Tidal fluctuations in Parkers Creek were monitored at one station (stilling well-7) at Landfill 8 (M-8) (Figure 4.2-12). (Hydrographs are presented in Appendix E.) Changes in creek stage were compared to changes in water levels measured at the following monitor wells: MW-12, MW-13, MW-14, and MW-15. Wells MW-13, MW-14, and MW-15 are located within 100 feet of Parkers Creek, and well MW-12 is approximately 1,300 feet from Parkers Creek. The tidal monitoring station at Landfill 8 (M-8) records incoming and outgoing tides, but the lowest tidal effects are subdued. Peaks in creek levels corresponding to high tides are sharp, but peaks in creek levels corresponding to low tides are rounded because the elevation of the stream bed is higher than the elevation of sea level at low tide. The elevation of the stream bed is -1.02 ft msl at stilling well-7. The maximum change in creek levels at Landfill 8 (M-8) was 3.3 feet, and the maximum change in water level in the monitor well was 1.4 feet during the time of study. All site monitor wells were screened below sea level.

Data collected from well MW-12 are useful as baseline data during the tidal monitoring study conducted at Landfill 8 (M-8). There is no apparent relationship between water levels measured at well MW-12 and creek levels measured at stilling well-7. Well MW-12 is approximately 1,300 feet from the creek and is too distant to be influenced by changing creek levels. Water levels in the water-bearing unit and creek levels were slowly declining by about 0.1 foot during the tidal monitoring study in March 1995.

The response of water levels measured at well MW-14 is dampened, indicating a poor to moderate hydraulic connection between the water-bearing unit at MW-14 and the creek levels. The peak in water levels measured at well MW-14 occurs from 60 to 200 minutes after the peak in creek level at stilling well-7, and the water-level peaks at MW-14 are only about 10% of the tidal peak in creek levels.

There is an apparent hydraulic influence between the water-bearing unit at MW-13 and creek levels. Water levels measured at MW-13 respond quickly to high tides recorded in the creek. The response of water levels at MW-13 to low tides in the creek is subdued probably because low tides have less effect on Parkers Creek in the area of MW-13. This is expected because MW-13 is approximately 2,400 feet upstream from stilling well-7, and tidal changes in the creek diminish in the upstream direction, as documented at Landfill 2 (M-2). The ratio of change in water level in the water-bearing unit to change in creek levels was not calculated for this location because of the distance between the well and the tidal monitoring station.

There is an apparent hydraulic connection between the water-bearing unit at MW-15 and creek levels. Water levels measured at well MW-15 respond quickly to rising and falling creek levels. The peak in water levels measured at well MW-15 occurs at approximately the same time as the peak in creek levels at stilling well-7. The response of water levels at MW-15 to low tides in the creek is slightly subdued. At this location (stilling well-7, MW-15) water-level peaks at MW-15 are approximately 30 to 40% of the tidal peak in creek levels.

4.2.7.6.1 Conductivity and Salinity Results

Conductivity and salinity were measured at Parkers Creek and monitor wells (MW-12 through MW-15) at Landfill 8 (M-8) in January and March 1995. Measurements were collected at low tide and high tide each month to evaluate the extent of saltwater intrusion at each site (see Tables E-1 through E-3 in Appendix E).

The results indicate the presence of brackish to salty water in Parkers Creek at Landfill 8 (M-8). Specific conductance measured in Parkers Creek at Landfill 8 (M-8) is consistently greater than

2,000 µmhos. In addition, salinity measured in Parkers Creek at Landfill 8 (M-8) is consistently greater than 1.5 ppth.

Groundwater sampled from monitor well MW-12 exhibited low conductivity and zero salinity. Monitor wells MW-13, MW-14, and MW-15 indicate possible brackish to saltwater intrusion in an area of the water-bearing unit close to Parkers Creek.

4.2.7.7 Recommendations

Due to highly turbid conditions and poor water-level recovery of the original monitor wells, all original monitor wells and piezometers were abandoned.

Groundwater sampling results indicate low concentrations of benzene and chlorobenzene were detected in two downgradient monitor wells, and PCE concentrations were detected in the upgradient well (MW-12) exceeding NJDEP GWQC. Additionally, PCE and other VOCs were previously detected in surface-water samples at location SS-7, downstream of site M-8.

Because the site formerly had an NJPDES permit, surface water has been sampled since 1986. However, surface water was not sampled at site M-8 during this investigation because the maximum VOC concentrations at this site during previous rounds of sampling were less than the maximum concentrations at sites M-2 and M-3, which are upstream. The concentrations of VOCs at site M-8 for previous rounds were less than the NJDEP surface-water criteria.

The results of the tidal monitoring indicate that there is no apparent relationship between creek levels and water levels in MW-12 because of its distance from the creek. A poor to moderate relationship was measured between MW-14 and creek levels. A direct relationship was observed between creek levels and MW-13 and MW-15. The conductivity and salinity measurements in Parkers Creek indicate the presence of brackish to salty water at site M-8. Groundwater sampled from MW-12 indicates freshwater. Monitor wells MW-13, MW-14, and MW-15 indicate brackish to salty water in an area of the water-bearing unit close to Parkers Creek.

Although groundwater sample results exceeded NJDEP criteria for three VOCs, immediate remedial action is not required. Shallow groundwater flows toward and discharges to Lafetra Creek, as indicated by water-level measurements in site monitor wells. There are no known uses of groundwater at or downgradient of the site. In fact, groundwater at three of the four monitor wells is brackish and unsuitable for drinking. No surface-water sampling was performed at this site during this project. Previous sampling rounds have indicated that VOC concentrations did not exceed NJDEP surface-water criteria in the stream. Therefore, there is little immediate threat to human health.

In addition, since the landfill has not been used for decades, the concentrations of VOCs seem, at worst, to be stable and possibly decreasing. Presumably, since no material is being added to the source (the landfill), natural degradation will decrease groundwater and surface-water contamination levels in the future.

Since the existing monitor wells and surface-water sampling locations are adequately placed to monitor downgradient groundwater and surface water, DPW proposes that a long-term surface-water and groundwater monitoring program be developed and implemented for the site. Aqueous samples would be collected and analyzed on a quarterly basis to further evaluate water quality conditions at the site. Groundwater samples would be collected from existing monitor wells and surface-water samples would be collected from points yet to be determined. Compounds of concern identified in the first two rounds of sampling would be targeted for the monitoring program.

METHODOLOGY SUMMARY

Method Summary

EPA SW-846 Method 8260
Gas Chromatographic Determination of Volatiles in Soil

A 50ul volume of methanol soil sample is added to 5-ml aliquot of water. Surrogates and internal standards are added and the sample is placed on a purge and trap concentrator. The sample as purged and desorbed into a GC/MS system. Volatiles are identified and quantitated. The final concentration is calculated using soil weight, percent moisture, methanol volume and concentration.

EPA SW-846 Method 8270
Gas Chromatographic Determination of Semi-volatiles in Soil

Surrogates are added to a 10-gram soil sample, which has been dried with sodium sulfate. The sample is then extracted using a soxtherm extractor. The extract is concentrated to 1 ml. Internal standards are added and the sample is injected into a GC/MS system. Semi-volatiles are identified and quantitated. The final concentration is calculated using soil weight, percent moisture and concentration.

EPA SW-846 Method 8080
Gas Chromatographic Determination of Pesticides and PCB's in Soil

Surrogates are added to a 10-gram soil sample, which has been dried with sodium sulfate. The sample is then extracted using a soxtherm extractor. The extract is concentrated to 10 ml. Internal standards are added and the sample is injected into a GC/ECD system. Pesticides and PCB's are identified and quantitated. The final concentration is calculated using soil weight, percent moisture and concentration.

EPA SW-846 Method 9045
pH Electrometric Measurement of Soils

20 ml of reagent water is added to a 20-gram soil sample. The sample is covered and then continuously stir the suspension for 5 minutes. Allow the suspension to stand for approximately 1 hour. Lower a calibrated glass electrode deep enough into the clear supernatant to obtain a pH measurement. Record this reading.

Methodology Summary

EPA SW-846 Method 3151, 3rd Edition Base Manual with Final Updates I, II, IIA, IIB, and III: Digestion TAL Metals

Milestone MLS 1200 MEGA
A representative sample of 1.0 to 0.5 g is digested in 10 ml of concentrated nitric acid for 10 minutes using microwave heating with a suitable laboratory microwave unit. The sample and acid are placed in a fluorocarbon (TFM) microvessel. This vessel is capped and heated in the microwave unit. After cooling the vessel contents are filtered and then diluted to 100ml volume and analyzed by ICP.

EPA SW-846 Method 6010B, 3rd Edition Base Manual with Final Updates I, II, IIA, IIB, and III: ICP TAL Metals

Perkin Elmer OPTIMA 3000 DV
The method measures element–emitted light by optical spectrometry. Samples are nebulized and the resulting aerosol is transported to the plasma torch. Radio-frequency inductively coupled plasma produces element-specific atomic-line emission spectra. The spectra are dispersed by a grating spectrometer, and a Segmented-array Charged-coupled-device Detector (SCD) monitors the intensities of the lines. Background and inter-elemental correction is used for trace element determinations.

EPA SW-846 Method 7471A, 3rd Edition Base Manual with Final Updates I, II, IIA, IIB, and III: Mercury

Varian SpectrAA-640, VGA-77
The flameless AA procedure is a physical method based on the absorption of radiation at 253.7 nm by mercury vapor. The mercury is reduced to the elemental state and aerated from solution in a closed system. The mercury vapor passes through a cell positioned in the light path of an atomic absorption spectrometer. Absorbance (peak height) is measured as a function of mercury concentration and recorded in the usual manner.

SOIL CLEAN-UP CRITERIA

Soil Cleanup Criteria

Compound	mg/kg
Acrolein	NLE
Acrylonitrile	1
tert-Butyl alcohol	NLE
Methyl-tert-Butyl ether	NLE
Di-isopropyl ether	NLE
Dichlorodifluoromethane	NLE
Chloromethane	520
Vinyl Chloride	2
Bromomethane	79
Chloroethane	NLE
Trichlorofluoromethane	NLE
1,1-Dichloroethene	8
Acetone	1000
Carbon Disulfide	NLE
Methylene Chloride	49
trans-1,2-Dichloroethene	1000
1,1-Dichloroethane	570
Vinyl Acetate	NLE
2-Butanone	1000
cis-1,2-Dichloroethene	79
Chloroform	19
1,1,1-Trichloroethane	210
Carbon Tetrachloride	2
Benzene	3
1,2-Dichloroethane	6
Trichloroethene	23
1,2-Dichloropropane	10
Bromodichloromethane	11
2-Chloroethyl vinyl ether	NLE
cis-1,3-Dichloropropene	4
4-Methyl-2-Pentanone	1000
Toluene	1000
trans-1,3-Dichloropropene	4
1,1,2-Trichloroethane	22
Tetrachloroethene	4
2-Hexanone	NLE
Dibromochloromethane	110
Chlorobenzene	37
Ethylbenzene	1000
Total Xylenes	410
Styrene	23
Bromoform	86
1,1,2,2-Tetrachloroethane	34
Anthracene	10000
Di-n-butylphthalate	5700
Fluoranthene	2300
Benzidine	NLE
Pyrene	1700
Butylbenzylphthalate	1100
Benzo(a)anthracene	0.9
3,3'-Dichlorobenzidine	2
bis(2-Ethylhexyl)phthalate	49
Di-n-octylphthalate	1100
Benzo(b)fluoranthene	0.9
Benzo(k)fluoranthene	0.9
Benzo(a)pyrene	0.66
Indeno(1,2,3-cd)pyrene	0.9

Compound	mg/kg
Pyridine	NLE
N-nitroso-dimethylamine	NLE
Aniline	NLE
Phenol	10000
bis(2-Chloroethyl)ether	0.66
2-Chlorophenol	280
1,3-Dichlorobenzene	5100
1,4-Dichlorobenzene	570
Benzyl alcohol	10000
1,2-Dichlorobenzene	5100
2-Methylphenol	2800
bis(2-chloroisopropyl)ether	2300
4-Methylphenol	2800
n-Nitroso-di-n-propylamine	0.66
Hexachloroethane	6
Nitrobenzene	28
Isophorone	1100
2-Nitrophenol	NLE
2,4-Dimethylphenol	1100
bis(2-Chloroethoxy) methane	NLE
2,4-Dichlorophenol	170
Benzoic Acid	NLE
1,2,4-Trichlorobenzene	68
Naphthalene	230
4-Chloroaniline	230
Hexachlorobutadiene	1
2,4,6-Trichlorophenol	62
2,4,5-Trichlorophenol	5600
2-Chloronaphthalene	NLE
4-Chloro-3-methylphenol	10000
2-Methylnaphthalene	NLE
Hexachlorocyclopentadiene	400
2-Nitroaniline	NLE
Dimethylphthalate	NLE
Acenaphthylene	NLE
2,6-Dinitrotoluene	NLE
3-Nitroaniline	NLE
Acenaphthene	3400
2,4-Dinitrophenol	110
4-Nitrophenol	NLE
Dibenzofuran	NLE
2,4-Dinitrotoluene	1
Diethylphthalate	10000
Fluorene	2300
4-Chlorophenyl-phenylether	NLE
4-Nitroaniline	NLE
4,6-Dinitro-2-methylphenol	NLE
n-Nitrosodiphenylamine	140
4-Bromophenyl-phenylether	NLE
Hexachlorobenzene	0.66
Pentachlorophenol	6
Phenanthrene	NLE
Dibenz(a,h)anthracene	0.66
Benzo(g,h,i)perylene	NLE
Azobenzene	NLE
Chrysene	9

NLE- No Limits Established

QUALIFIER CODES

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEPE # 13461

Definition of Qualifiers

MDL	: Method Detection Limit
J	: Compound identified below detection limit
B	: Compound in both sample and blank
D	: Results from dilution of sample
U	: Compound searched for but not detected
E	: Compound exceeds calibration limit

Lab Name: FMETL Project: 98-0211

Lab Code: 13461 Case No.: 4490 Location: M-8 SDG No.:

Matrix: (soil/water) SOIL Lab Sample ID: 4490.12(1:10)

Sample wt/vol: 10.08 (g/ml) G Lab File ID: BN03455.D

Level: (low/med) LOW Date Received: 5/17/99

% Moisture: 3.72 decanted:(Y/N) N Date Extracted: 5/20/99

Concentrated Extract Volume: 1000 (uL) Date Analyzed: 6/4/99

Injection Volume: 1.0 (uL) Dilution Factor: 10.0

GPC Cleanup: (Y/N) N pH:

CAS NO.	COMPOUND	CONCENTRATION UNITS: (ug/L or ug/Kg) UG/KG	Q
83-32-9	Acenaphthene	10000	U
51-28-5	2,4-Dinitrophenol	10000	U
132-64-9	Dibenzofuran	10000	U
100-02-7	4-Nitrophenol	10000	U
121-14-2	2,4-Dinitrotoluene	10000	U
84-66-2	Diethylphthalate	10000	U
86-73-7	Fluorene	10000	U
7005-72-3	4-Chlorophenyl-phenylether	10000	U
100-01-6	4-Nitroaniline	10000	U
534-52-1	4,6-Dinitro-2-methylphenol	10000	U
86-30-6	n-Nitrosodiphenylamine	10000	U
103-33-3	Azobenzene	10000	U
101-55-3	4-Bromophenyl-phenylether	10000	U
118-74-1	Hexachlorobenzene	10000	U
87-86-5	Pentachlorophenol	10000	U
85-01-8	Phenanthrene	10000	U
120-12-7	Anthracene	10000	U
84-74-2	Di-n-butylphthalate	10000	U
206-44-0	Fluoranthene	10000	U
92-87-5	Benzidine	10000	U
129-00-0	Pyrene	10000	U
85-68-7	Butylbenzylphthalate	10000	U
56-55-3	Benzo[a]anthracene	10000	U
91-94-1	3,3'-Dichlorobenzidine	10000	U
218-01-9	Chrysene	10000	U
117-81-7	bis(2-Ethylhexyl)phthalate	10000	U
117-84-0	Di-n-octylphthalate	10000	U
205-99-2	Benzo[b]fluoranthene	10000	U
207-08-9	Benzo[k]fluoranthene	10000	U
50-32-8	Benzo[a]pyrene	10000	U
193-39-5	Indeno[1,2,3-cd]pyrene	10000	U
53-70-3	Dibenz[a,h]anthracene	10000	U
191-24-2	Benzo[g,h,i]perylene	10000	U
