NJDEP Certification # 13461

Client: U.S. Army
DPW, SELFM-PW-EV
Bldg. 173
Ft. Monmouth, NJ 07703

Lab ID #: 5227.09
Sample Received: 03/07/00
Sample Matrix: Aqueous

Site: M-2

Field ID#: 00M2MW06

TAL-METALS RESULTS SUMMARY (ug/L)

Element	Date of Analysis	Result (ug/L)	Regulatory Level (ug/L)*	MDL (ug/L)
Aluminum	04/06/00	753	200	10.0
Antimony	04/06/00	566	20	2.0
Arsenic	04/06/00	5.60	8	2.0
Barium	04/06/00	189	2000	0.5
Beryllium	04/06/00	ND	20	0.5
Cadmium	04/06/00	3.28	4	0.5
Calcium	04/06/00	41600	NLE	20.0
Chromium	04/06/00	16000	100	0.5
Cobalt	04/06/00	29.3	NLE	0.5
Copper	04/06/00	9.64	1000	3.0
Iron	04/06/00	45000	300	10.0
Lead	04/06/00	ND	10	2.0
Magnesium	04/06/00	14100	NLE	20.0
Manganese	04/06/00	247	50	0.5
Mercury	03/30/00	ND	2	0.1
Nickel	04/14/00	ND	100	20.0
Potassium	04/06/00	5490	NLE	20.0
Selenium	04/06/00	ND	50	3.0
Silver	04/06/00	ND	20	3.0
Sodium	04/06/00	4540	50000	20.0
Thallium	04/06/00	6.70	10	3.0
Vanadium	04/06/00	35.8	NLE	1.0
Zinc	04/06/00	11.3	5000	1.0

ND = Not Detected, MDL = Method Detection Limit, NLE = No Limit Established
* Higher of PQL's and Ground Water Quality Criteria as per N.J.A.C. 7:9-6

Report of Analysis

METHODOLOGY SUMMARY

PARAMETER	REFERENCE
TARGET ANALYTE LIST	Standard Methods, 18th ed.
Aluminum	3120B
Antimony	3120B
Arsenic	3120B
Barium	3120B
Beryllium	3120B
Cadmium	3120B
Calcium	3120B
Chromium	3120B
Cobalt	3120B
Copper	3120B
Iron	3120B
Lead	3120B
Magnesium	3120B
Manganese	3120B
Mercury	3112B
Nickel	3120B
Potassium	3120B
Selenium	3120B
Silver	3120B
Sodium	3120B
Thallium	3120B
Vanadium	3120B
Zinc	3120B
TARGET COMPOUND LIST	Federal Register 40 CFR Part 136 Appendix A
Base/Neutrals and Acid Extractables by GC/MS	625
Purgeable Organcis by GC/MS	624
Pesticides and PCB's by GC	608

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEP CERTIFICATION # 13461

Definition of Qualifiers

MDL	: Method Detection Limit
J	: Compound Identified Below Detection Limit
B	: Compound is in Both Sample and Blank
D	: Results are from a Dilution of the Sample
U	: Compound Searched for but not Detected
E	: Compound Exceeds Calibration Limit

Volatile Analysis Report
U.S. Army, Fort Monmouth Environmental Laboratory
NJDEP Certification #13461

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEP CERTIFICATION # 13461

Definition of Qualifiers

MDL : Method Detection Limit
J : Compound Identified Below Detection Limit
B : Compound is in Both Sample and Blank
D : Results are from a Dilution of the Sample
U : Compound Searched for but not Detected
E : Compound Exceeds Calibration Limit

Enviornmental Laboratory

Certification Number 13461

October 5, 1946 Sampling For VOCs

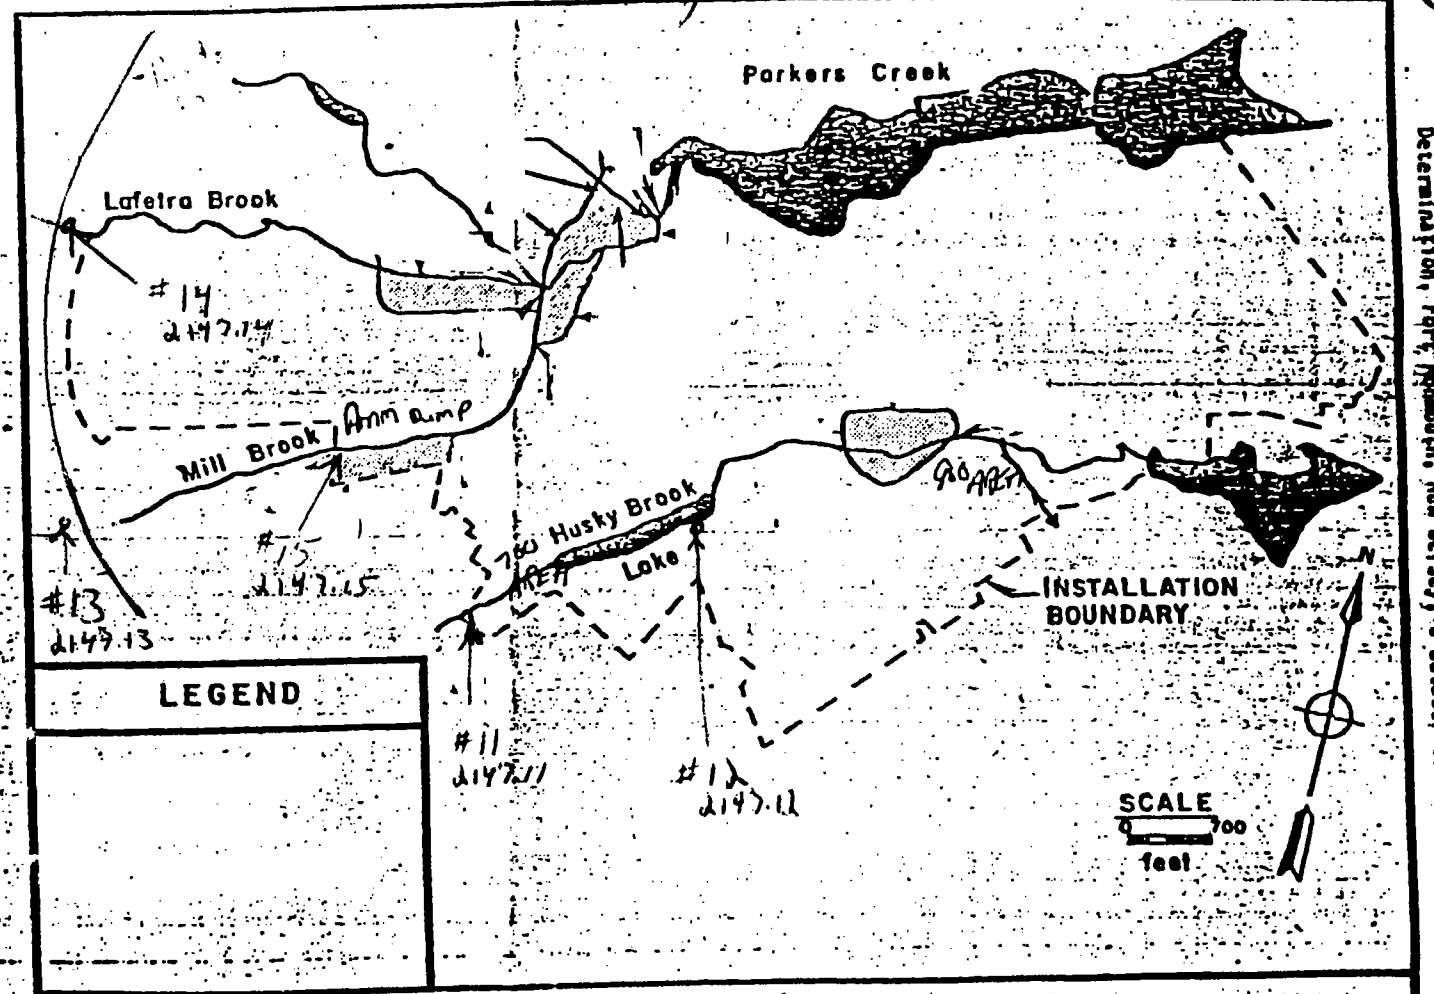

FIGURE. SAMPLING POINTS

Water Quality Engineering Consultation No. 32-24-0725-86, Stream and Ground-Water Monitoring Well Sampling for Landfill Discharge Determination, Fort Monmouth, New Jersey, 1 October 1985

601/602 Analysis Data Sheet

Sample I.D.: **M.Blank**
Misc. ID:
Date Analyzed: **10/21/96**

Lab Name: **Fort Monmouth Environmental Testiong Lab.** Contract: **9600**
Lab Code: **13461** Case No.:
Matrix: **Water** Method: **601_2.MTH**
Wt/Vol.: **5 ml** Dilution Factor: **1**
File: C:\HPCHEM\6\DATA\102103.D

Results:
Concentration Units: **ug/L**

Compound #	Compound	Expected R.T.	R.T.	Amount	MDL
1	Dichlorodifluoromethane	3.69	NA	<	0.04

NJDEP CERTIFICATION # 13461

Definition of Qualifiers

MDL	: Method Detection Limit
J	: Compound Identified Below Detection Limit
B	: Compound is in Both Sample and Blank
D	: Results are from a Dilution of the Sample
U	: Compound Searched for but not Detected
E	: Compound Exceeds Calibration Limit

UPDATED 17 JANUARY 1997

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEPE # 13461

Definition of Qualifiers

MDL : Method Detection Limit
J : Compound identified below detection limit
B : Compound in both sample and blank
D : Results from dilution of sample
U : Compound searched for but not detected

Volatile Analysis Report

NJDEP Certification #13461

Data File **V02369.d**
Operator **Skelton**
Date Acquired **04-Nov-97**

Sample Name **Daily Blank**
Field ID **Daily Blank**
Sample Multiplie **1**

CAS#	Compound Name	R.T.	Response	Result	Regulatory Level (ug/l)*	MDL	Qualifiers
107028	Acrolein			not detected	320	6.25 ug/L	
107131	Acrylonitrile			not detected	0.665	6.25 ug/L	
75650	tert-Butyl alcohol			not detected	nle	12.50 ug/L	
1634044	Methyl-tert-Butyl ether			not detected	nle	2.50 ug/L	
108203	Di-isopropyl ether			not detected	nle	1.25 ug/L	
	Dichlorodifluoromethane			not detected	nle	3.63 ug/L	
74-87-3	Chloromethane			not detected	5.7	0.79 ug/L	
75-01-4	Vinyl Chloride			not detected	0.083	2.61 ug/L	
74-83-9	Bromomethane			not detected	48.4	1.45 ug/L	
75-00-3	Chloroethane			not detected	nle	2.20 ug/L	
75-69-4	Trichlorofluoromethane			not detected	nle	1.31 ug/L	
75-35-4	1,1-Dichloroethene			not detected	4.81	0.74 ug/L	
67-64-1	Acetone			not detected	nle	1.57 ug/L	
75-15-0	Carbon Disulfide			not detected	nle	0.54 ug/L	
75-09-2	Methylene Chloride			not detected	2.49	1.66 ug/L	
156-60-5	trans-1,2-Dichloroethene			not detected	592	0.50 ug/L	
75-35-3	1,1-Dichloroethane			not detected	nle	0.83 ug/L	
108-05-4	Vinyl Acetate			not detected	nle	2.07 ug/L	
78-93-3	2-Butanone			not detected	nle	2.06 ug/L	
	cis-1,2-Dichloroethene			not detected	nle	0.65 ug/L	
67-66-3	Chloroform			not detected	5.67	0.43 ug/L	
75-55-6	1,1,1-Trichloroethane			not detected	127	0.81 ug/L	
56-23-5	Carbon Tetrachloride			not detected	0.363	1.20 ug/L	
71-43-2	Benzene			not detected	0.15	0.51 ug/L	
107-06-2	1,2-Dichloroethane			not detected	0.291	1.27 ug/L	
79-01-6	Trichloroethene			not detected	1.09	0.94 ug/L	
78-87-5	1,2-Dichloropropane			not detected	nle	0.78 ug/L	
75-27-4	Bromodichloromethane			not detected	0.266	0.77 ug/L	
110-75-8	2-Chloroethyl vinyl ether			not detected	nle	1.05 ug/L	
10061-01-5	cis-1,3-Dichloropropene			not detected	nle	0.60 ug/L	
108-10-1	4-Methyl-2-Pentanone			not detected	nle	1.33 ug/L	
108-88-3	Toluene			not detected	7440	0.73 ug/L	
10061-02-6	trans-1,3-Dichloropropene			not detected	0.193	1.43 ug/L	
79-00-5	1,1,2-Trichloroethane			not detected	13.5	1.49 ug/L	
127-18-4	Tetrachloroethene			not detected	0.388	0.92 ug/L	
591-78-6	2-Hexanone			not detected	nle	1.12 ug/L	
126-48-1	Dibromochloromethane			not detected	72.6	1.36 ug/L	
108-90-7	Chlorobenzene			not detected	22	0.66 ug/L	
100-41-4	Ethylbenzene			not detected	3030	1.14 ug/L	
1330-20-7	m+p-Xylenes			not detected	nle	2.53 ug/L	
1330-20-7	o-Xylene			not detected	nle	1.92 ug/L	
100-42-5	Styrene			not detected	nle	1.57 ug/L	
75-25-2	Bromoform			not detected	4.38	1.68 ug/L	
79-34-5	1,1,2,2-Tetrachloroethane			not detected	1.72	1.71 ug/L	
541-73-1	1,3-Dichlorobenzene			not detected	2620	2.51 ug/L	
106-46-7	1,4-Dichlorobenzene			not detected	343	3.08 ug/L	
95-50-1	1,2-Dichlorobenzene			not detected	2520	2.75 ug/L	

* Water Quality Criteria as per N.J.A.C. 7:9-6 2-Sept-97

Qualifiers

B = Compound found in related blank
E = Value above linear range
D = Value from dilution
PQL = Practical Quantitation Limit

MDL = Method Detection Limit
NLE = No Limit Established
R.T. = Retention Time

Check the appropriate answer

1. Did the samples come in a cooler?	☒ yes	☐ no	☐ NA
2. Were the chain of custody papers filled out correctly and legibly?	☒ yes	☐ no	
3. Did you sign the chain of custody in the appropriate place?	☒ yes	☐ no	
4. Did all the labels agree with the chain of custody and in good condition?	☒ yes	☐ no	
5. Were the correct containers and/or preservatives used for the tests indicated?	☒ yes	☐ no	
6. Was a sufficient amount of sample sent for the tests indicated?	☒ yes	☐ no	
7. Were bubbles absent from aqueous VOC sample containers?	☒ yes	☐ no	☐ NA

Fill out the following table for each sample bottle

SAMPLE RECEIPT FORM

Date Received: 11-7-98 Day 1 Lab Project ID#: 4060

Site/Project Name: 411 8th & B Street Cooler Temp (deg. C): 0.0c

Received By: J. Verquer Sign: J. Verquer
(print name)

Check the appropriate answer

1. Did the samples come in a cooler?	☒ yes	☐ no	☐ NA
2. Were the chain of custody papers filled out correctly and legibly?	☒ yes	☐ no	
3. Did you sign the chain of custody in the appropriate place?	☒ yes	☐ no	
4. Did all the labels agree with the chain of custody and in good condition?	☒ yes	☐ no	
5. Were the correct containers and/or preservatives used for the tests indicated?	☒ yes	☐ no	
6. Was a sufficient amount of sample sent for the tests indicated?	☒ yes	☐ no	
7. Were bubbles absent from aqueous VOC sample containers?	☒ yes	☐ no	☐ NA

Fill out the following table for each sample bottle

CASE NARRATIVE

Site: Streams

Lab ID: 4060/4069

The duplicate taken on 11/17/98 was performed on Stream Site 05 (4060.10).

The duplicate taken on 11/18/98 was performed on Stream Site 13 (4069.11).

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEPE # 13461

Definition of Qualifiers

MDL : Method Detection Limit
J : Compound identified below detection limit
B : Compound in both sample and blank
D : Results from dilution of sample
U : Compound searched for but not detected

Change of Chain of Custody

Lab Project ID#: 4300.1-20 Site/Project Name: 1st QTR-Streams

Date Received: 2/25/99 Date of Change: 3/17/99

Requested by: print P. Skelton Sign: _____

Turnaround Time: 4 WKS

1. Were the correct containers and/or preservatives used for the tests indicated? (Yes) No
2. Was a sufficient amount of sample sent for the tests indicated? (Yes) No
3. Are samples Within Holding time for new analysis? (Yes) No
4. Was the change documented in the sample receipt log book? (Yes) No

Received by: print J. Vergara Sign: J. Vergara

CASE NARRATIVE

Site: Streams

Lab ID: 48021, 4806

The field duplicate, taken on 9/21/99 was performed on Stream Site #22.
The field duplicate, taken on 9/22/99 was performed on Stream Site #07.

VOLATILES

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEPE # 13461

Definition of Qualifiers

MDL	: Method Detection Limit
J	: Compound identified below detection limit
B	: Compound in both sample and blank
D	: Results from dilution of sample
U	: Compound searched for but not detected
E	: Compound exceeds calibration limit

Volatile Analysis Report

VOLATILES

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEPE # 13461

Definition of Qualifiers

MDL	: Method Detection Limit
J	: Compound identified below detection limit
B	: Compound in both sample and blank
D	: Results from dilution of sample
U	: Compound searched for but not detected
E	: Compound exceeds calibration limit

Remarks: Tide Low

Landfill Stream Sediment PCB's Sample Event Site Field Summary for M2

Mill Creek runs along the northern side of the M2 landfill for approximately 1400 feet. Certain portions of the creek have had heavy restoration work started. This work consists of large rock and rip-rap. The remainder of the bank has been left as it was. Man made materials are present in, and on the bank in these areas, with trees and bramble as the main vegetation. The bank is steep as well. Fallen trees, and man made debris in the creek are scattered the entire length.

Flow is constant, with depth tidally affected. It is not however, greatly affected. Pools exist, and range from 1- 5 feet deep. The remainder of the bed is shallow, never less than 3 inches. Tide was low at time of sampling. The weather was sunny, and warm.

Depositional areas were numerous, with many often large and slightly submerged. Sampling targeted these areas. Where there was not a depositional area, 1 sample per 100 feet was taken.

Site Contact Person: Joseph Fallon
Address: U.S. Army Fort Monmouth, New Jersey
Directorate of Public Works
Building 167
Fort Monmouth, NJ 07703
Phone Number: (732) 532-6223

DEP Lead Program (609) 633-1455
DEP Remedial Action Workplan Approval Document Dated

Description of CEA:

Pursuant to N.J.A.C. 7:9-6.5, groundwater in this area is presently designated as Class II-A. The primary designated use for Class II-A groundwater is potable water; secondary uses include agricultural and industrial water. Any proposed groundwater use within the Classification Exception Area (CEA) will require New Jersey Department of Environmental Protection (NJDEP) review for feasibility of well installation and modifications that would be protective of any impacts from these contaminants for the duration of the CEA.

This CEA/Well Restriction Area (WEA) applies only to the contaminants listed in the table below. The groundwater criteria/primary drinking water standards for these contaminants are listed in parts per billion (ppb). All constituent standards (N.J.A.C. 7:9-6) apply at the designated boundary.

Contaminant	Ground Water Quality Criteria (ppb)
Benzene	1
Chlorobenzene	4

CEA Boundaries: See Figure 11 (Location of the Proposed CEA depicted on a USGS Quadrangle Map).

Project Term of CEA: 9 Years

EXECUTIVE SUMMARY

The following sections of this report provide the information required to define the CEA for the Site. This information includes:

- Relevant information regarding the site, including a description of subsurface stratigraphic and hydrogeologic conditions;
- A description of the ground water quality at the site;
- A description of the previous investigation/remediation program;
- A list of constituents of concern that are known to be present at concentrations above applicable Ground Water Quality Criteria (GWQC) at the site;
- A determination of the horizontal and vertical extent of the CEA;
- A determination of the duration of the CEA;
- A written and mapped description of the CEA, including electronic and paper copies of a map of the CEA that are compatible with the GIS system;
- An evaluation of the area encompassed by the CEA to determine if the area is a ground water use area as defined by NJDEP; and
- Notification to the appropriate agencies of the intent to establish the CEA.

I. INTRODUCTION

This report discusses current ground water conditions and proposes a ground water classification exception area (CEA) at the M-2 Landfill (the Site), in Fort Monmouth, New Jersey. The work recently completed consisted of a summary of the ground water sample collection at the Site, and modeling of the fate and migration of constituents of concern in ground water beneath the Site. Versar Inc. (Versar) conducted the work and prepared this report on behalf of United States (U.S.) Army Fort Monmouth (Fort Monmouth), Directorate of Public Works (DPW), Fort Monmouth, New Jersey. All work has been completed in accordance with the current New Jersey Department of Environmental Protection (NJDEP) guidance; specifically, the procedures described in the *Final Guidance on Designation of CEAs and the Regulatory Requirements*, NJAC 7:9-6.6, published on November 1998.

II. BACKGROUND

A. Site Setting and History of Site Operations

Fort Monmouth is located in the central-eastern portion of New Jersey in Monmouth County, approximately 45 miles south of New York City and 70 miles northeast of Philadelphia **(Figure 1**). In addition to the Main Post, the installation includes two subposts, the Charles Wood Area and Evans Area. The Main Post encompasses approximately 630 acres and is generally bounded by State Highway 35, Parkers Creek, Lafetra Brook, the New Jersey Transit Railroad, and a residential area to the south. The post was established in 1918 during World War I (WW I) as an Army Signal Corps training center. The Main Post currently provides administrative, training, and housing support functions, as well as providing many of the community facilities for Fort Monmouth. The primary mission of Fort Monmouth is to provide command, administrative, and logistical support for Headquarters, U.S. Army Communications and Electronics Command (CECOM). CECOM is a major subordinate command of the U.S. Army Materiel Command (AMC) and is the host tenant at Fort Monmouth.

The M-2 Landfill, comprised of 6.5 acres, is located on the south bank of Mill Creek in the southwestern corner of the Main Post area of Fort Monmouth, Monmouth County, New Jersey. According to a report prepared by the U.S Army Toxic and Hazardous Materials Agency (USATHAMA) entitled, *Installation Assessment of Fort Monmouth, Report 171*, dated May 1980, the M-2 Landfill was in use between 1964 and 1968 (and possibly into 1969) for general disposal of domestic and industrial wastes. The M-2 Landfill has reportedly been inactive since 1969. Since the landfill closure circa 1969, the past 30+ years have seen the growth and stabilization of vegetation (i.e., grass, trees, brush) on the M-2 Landfill.

Suspected hazardous waste sites at Fort Monmouth were initially identified in the Installation Assessment (IA) (USATHAMA, 1980). This report identified 37 sites with known or suspected waste materials at Fort Monmouth. WESTON then, conducted a background investigation on these sites and on eight additional sites, identified by Fort Monmouth and the NJDEP. WESTON's Report (WESTON, 1993) recommended additional investigations at 22 of the sites, including the M-2 Landfill, and the NJDEP approved the recommendations on 20 April 1994. WESTON performed additional field investigation activities at these 22 sites, including the M-2 Landfill, between November 1994 and November 1995. The field investigation activities

included surface geophysical investigations, sediment and surface-water sampling, transformer site sampling, surface and subsurface soil sampling, groundwater monitoring well installation and sampling, and tidal monitoring. The results of these investigation activities were presented in the WESTON Report entitled, *Final Site Investigation, Fort Monmouth, New Jersey, Main Post and Charles Wood Areas, Site Investigation Report*, December 1995.

As stated in the WESTON Report that investigated suspected waste sites at Fort Monmouth (WESTON, 1993) and the Site Investigation (SI) Report (WESTON, 1995), materials generally found in Main Post landfills included unwashed pesticide/herbicide cans, batteries, fluorescent tubes, electronic components, garbage, asbestos wrappings from pipes, soot and boiler scale, sludge from sanitary treatment plants (STPs), small quantities of outdated drugs, outdated photographic chemicals in glass bottles, building rubble (including asbestos-containing materials [ACM]), incinerator ash, sand from oil spill cleanups, and other debris. In addition, specific wastes reportedly known to have been placed in the M-2 Landfill included oil in cans, oil burner filters, and soot. The banks along Mill Creek near the west end of the landfill had also reportedly been covered with building rubble (concrete, cinder blocks, etc.) to stabilize the bank. Since the landfill's closure circa 1969, the past 30 plus years have seen the growth and stabilization of vegetation (i.e., grass, trees, bushes) on the M-2 landfill. **Figure 2** presents a well location map and site map for the M-2 Landfill.

A Remedial Investigation Report (RIR) and Remedial Action Workplan (RAW) have been prepared by Versar for the M-2 Landfill, based on work performed by Versar in the summer of 2000, TECOM-Vinnell Services (TVS) in February 1999, and Roy F. Weston, Inc. (WESTON) in 1995. Information presented in the RIR/RAW is summarized in the following sections.

B. Geology, Hydrogeology, Topography, Surface Water and Wetlands

The following is a description of the geological/hydrogeological setting of the area surrounding the M-2 Landfill. Included is a description of the regional geology of the area surrounding Fort Monmouth, as well as descriptions of the local geology and hydrogeology of the Main Post area. Two hydrogeologic cross-sections depicting the geology and the water levels at the M-2 Landfill are presented in **Figure 3.**

B.1 Geology

Regional Geology

Monmouth County lies within the New Jersey Section of the Atlantic Coastal Plain physiographic province. The M-2 Landfill is located in what may be referred to as the Outer Coastal Plain subprovince, or the Outer Lowlands.

In general, New Jersey Coastal Plain formations consist of a seaward-dipping wedge of unconsolidated deposits of clay, silt, sand and gravel. These formations typically strike northeast-southwest with a dip ranging from 10 to 60 ft (ft) per mile and were deposited on Precambrian and lower Paleozoic rocks (Zapecza, 1989). These sediments, predominantly derived from deltaic, shallow marine, and continental shelf environments, date from Cretaceous through the Quaternary Periods. The mineralogy ranges from quartz to glauconite.

The formations record several major transgressive/regressive cycles and contain units, which are generally thicker to the southeast and reflect a deeper water environment. More than 20 regional geologic units are present within the sediments of the Coastal Plain. Regressive, upward coarsening deposits are usually aquifers (e.g., Englishtown and Kirkwood Formations, and the Cohansey Sand), while the transgressive deposits act as confining units (e.g., the Merchantville, Marshalltown, and Navesink Formations). The individual thickness for these units varies greatly (i.e., from several ft to several hundred ft). The Coastal Plain deposits thicken to the southeast from the Fall Line (i.e., a boundary zone between older, resistant rocks and younger, softer plain sediments) to greater than 6,500 ft in Cape May County (Brown and Zapecza, 1990).

Local Geology

Based on the regional geologic map (Jablonski, 1968), the Cretaceous age Red Bank and Tinton Sands outcrop at the Main Post area. The Red Bank Sand conformably overlies the Navesink Formation and dips to the southeast at 35 ft per mile. The upper member (Shrewsbury) of the Red Bank Sand is a yellowish-gray to reddish brown clayey, medium-to-coarse-grained sand that contains abundant rock fragments, minor mica and glauconite (Jablonski). The lower member (Sandy Hook) is a dark gray to black, medium-to-fine grained sand with abundant clay, mica, and glauconite.

The Tinton Sand conformably overlies the Red Bank Sand and ranges from a clayey medium to very coarse-grained feldspathic quartz and glauconite sand to a glauconitic coarse sand. The color varies from dark yellowish orange or light brown to moderate brown and from light olive to grayish olive. Glauconite may constitute 60 to 80 percent of the sand fraction in the upper part of the unit (Minard, 1969). The upper part of the Tinton is often highly oxidized and iron oxide encrusted (Minard 1969). Boring and monitoring well logs for the sample borings and monitoring wells installed in the M-2 Landfill give descriptions for soils at the site to consist of an earthen cover underlain by fill material. Beneath the fill is naturally occurring silty sand. Groundwater occurs beneath the site at a depth of approximately 8 ft. Natural soils beneath the fill are similar to the reported descriptions of the Tinton Sand member of the Red Band Sand.

The Kirkwood Formation (part of the Kirkwood-Cohansey system) crops out southeast of the Main Post and dips to the southeast at a slope of 20 ft per mile (Jablonski, 1968). The Kirkwood Formation consists of alternating layers of sand and clay. The upper unit is a light gray to yellowish-brown, fine-grained quartz sand with quartz nodules and small pebbles. The lower unit is a brown silt in Monmouth County (Jablonski, 1968).

Soils

According to the U.S. Department of Agriculture (USDA), Soil Conservation Service, Monmouth County Soil Survey, the majority of the Main Post is covered by urban land. The soil survey described urban land as areas where concrete, asphalt, buildings, shopping centers, airports, or other impervious surfaces cover 80 percent or more of the surface. In addition, the survey indicated that the natural subsurface soils have largely been replaced with artificial or foreign fill materials (developed land with disturbed soils). The following soil series and classification units are mapped in the Main Post area:

- DoB Downer sandy loam (with 2 to 5 percent slopes);
- FrB Freehold sandy loam (with 2 to 5 percent slopes);
- FUB Freehold sandy loam/urban land complex (with 0 to 10 percent slopes);
- HV Humaquepts, frequently flooded;
- KvA Kresson loam (with 0 to 5 percent slopes);
- UA Udorthents, smoothed; and
- UD Udorthents – urban land complex (with 0 to 3 percent slopes).

The Downer series soils are well-drained soils that are found on uplands and terraces. The soils are formed in acid, silty coastal plain sediments. The Freehold soils are also well drained and are formed in acid, loamy, coastal plain sediments that, by volume, are 1 to 10 percent glauconite and are found on uplands. The Humaquepts soils are somewhat poorly- to very poorly- drained soils that are formed in stratified, sandy, or loamy sediments of fluvial origins. The Humaquepts soils are located on the floodplain and are subject to flooding several times each year. The Kresson loam is a nearly level to gently sloping soil and is somewhat poorly drained. The soil is found on low divides and in depressions. The Udorthents soils have been altered by excavation or filling activities. In filled areas, these soils consist of loamy material that is more than 20 inches thick. The filled areas include floodplain, tidal marshes, and areas with moderately, well drained to very poorly drained soils. Some Udorthent soils contain concrete, asphalt, metal, and glass.

B.2 Hydrogeology

Regional Hydrogeology

Fort Monmouth lies in the Atlantic and Eastern Gulf Coastal Plain groundwater region (Meisler et al., 1988). This groundwater region is underlain by undeformed, unconsolidated to semi-consolidated sedimentary deposits. The chemistry of the water near the surface is variable with low dissolved solids and high iron concentrations. The water chemistry in areas underlain by glauconitic sediments (such as Red Bank and Tinton Sands) is dominated by calcium, magnesium, and iron. The sediments in the area of Fort Monmouth were deposited in fluvial-deltaic to nearshore environments.

The water table aquifer in the Main Post area is identified as part of the "composite confining units," or minor aquifers. The minor aquifers include the Navesink formation, Red Bank Sand, Tinton Sand, Hornerstown Sand, Vincentown Formation, Manasquan Formation, Shark River Formation, Piney Point Formation, and the basal clay of the Kirkwood Formation.

Well records indicate that wells installed in the Red Bank and Tinton Sands produce 2 to 25 gallons per minute (gpm). Water in these upper hydrogeologic units is typically encountered at shallow depths below ground surface (2 to 9 ft bgs). However, domestic wells are generally screened deeper in these upper hydrogeologic units. The shallow water table conditions in the Tinton and Red Bank Sands, and the similar composition of these sands within the Kirkwood Formation, suggest that the Tinton-Red Bank-Kirkwood sequence forms a single, laterally continuous aquifer. Water in this water table aquifer will flow east toward the Atlantic Ocean. Local topography will tend to deflect the flow toward local depressions.

As stated in the SI Report (WESTON, 1995), NJAC 7:9-6, *Groundwater Quality Standards,* establishes groundwater criteria for different classes of groundwater. Class II-A, which is defined as all groundwater that is not classified as one of the other special classes, is the class for groundwater at Fort Monmouth. The primary designated use for Class II-A ground water is potable water; secondary uses include agricultural and industrial water.

Local Hydrogeology

Shallow groundwater is locally influenced within the Main Post area by the following factors:

- Tidal influence (based on proximity to the Atlantic Ocean, rivers, and tributaries)
- Topography
- Nature of the fill material within the Main Post area
- Presence of clay and silt lenses in the natural overburden deposits
- Local groundwater recharge areas (i.e., streams, lakes)

Due to the fluvial nature of the overburden deposits (i.e., sand and clay lenses), shallow groundwater flow direction is best determined on a case-by-case basis. The groundwater flow in the vicinity of the M-2 Landfill has been determined based on recent groundwater elevation measurements (**Table 1**) to be north-northwest towards Mill Creek (**Figures 4A and 4B**).

B.3 Topography

Over the last 80 years, the natural topography of Fort Monmouth has been altered by excavation and filling activities by the military. The land surface at the Main Post is relatively flat and ranges in elevation from 4 ft above mean sea level (msl) in the east at Oceanport Creek to 32 ft msl at the western end of the post, near Highway 35. The eastern half of the post is generally 10 ft msl in elevation.

B.4 Surface Water and Wetlands

Surface water runoff from the western part of the Main Post flows into the Lafetra Creek to the north or into the Mill Creek to the south. The USGS map (**Figure 1**) shows the Lafetra Creek as Parkers Creek Branch and Mill Creek as Wampum. Both Mill and Lafetra Creek originate off-post. Mill Creek flows along the southern boundary of the Main Post, turning north just past the Auto Craft Shop. Mill Creek is channelized and flows past the north side of the M-2 Landfill. Lafetra Creek forms the northern boundary of the Main Post and joins Mill Creek to form Parkers Creek. Parkers Creek flows eastward along the northern boundary and joins Oceanport Creek east of the post. Most of Parkers Creek, Lafetra Creek, and Mill Creek are tidally influenced.

The U.S Fish and Wildlife Service (FWS) National Wetland Inventory Long Branch quadrangle maps indicate the presence of wetlands at the Main Post. Parkers and Oceanport Creeks are classified as estuarine intertidal aquatic beds. The area of Parkers Creek and the part of Oceanport Creek/Husky Brook are classified as estuarine intertidal emergent wetlands. Lafetra Creek and Mill Creek are classified as riverine lower perennial open water/unknown bottom.

III. CONSTITUENTS OF CONCERN

A. Monitoring of Constituents of Concern

The NJDEP requires that the Classification Exception Area (CEA) application specify the constituents of concern (COC) that will require an exception to the ground water quality criteria (GWQC). These are constituents that necessitate the institution of a CEA because they are either currently detected or are anticipated to be detected at concentrations above the applicable GWQC.

Quarterly ground water sampling was conducted between May 1997 and June 2000. Analytical results are summarized in the RIR/RAWP Report and in **Tables 2A** through **2E** of this CEA proposal. Sample locations and associated concentrations are shown in **Figures 5A and 5B**.

Of the 24 monitoring wells installed in, or adjacent to, the M-2 Landfill, eight wells (MW-2, 3, 8, 9, 11, 21, 23 and 24) contain detectable amounts of benzene, chlorobenzene and metals (principally aluminum, iron and manganese) in all or most of the sampling events at concentrations above the respective GWQC. The other monitoring wells in the landfill have consistently contained detectable amount of solely metals. Metal concentrations are generally comparable to the Fort Monmouth site-specific and Monmouth County maximum background concentrations established in the RIR. Comparison of over three years of groundwater analytical data with the surface water data collected from Mill Creek (adjacent to the landfill) indicates that the groundwater beneath the landfill is not affecting surface water quality.

Data from the most recent sampling rounds indicate two VOC, benzene and chlorobenzene, which will require an exception to the GWQC due to their concentrations above the GWQC in one or more of the monitoring wells. Groundwater benzene and chlorobenzene concentration contours are presented in **Figures 6A, 6B, 7A and 7B.** Metal concentrations above GWQC will not be considered COC due to their probable association with site background levels, and due to their immobility (high Kd, implicit retardation) in the subsurface.

B. Natural Attenuation of Benzene and Chlorobenzene

Graphs of benzene and chlorobenzene ground water concentrations versus time are presented as Figures A-1 through A-5, for those monitoring points where benzene and chlorobenzene were historically detected. As indicated by these graphs, there is a downward trend in concentrations over time, which is primarily caused by sorption and bioremediation at these concentrations. Secondary causes include a combination of advection and dispersion.

There are several compound-specific parameters and processes that can control the degradation or migration of a compound in the subsurface. These compound-specific parameters include the organic carbon/water partitioning coefficient (Koc) of the compound, the solubility of the compound in water, the specific gravity of the compound relative to water, the vapor pressure of the compound, and the susceptibility of the compound to transformation or degradation by organisms. In our calculations for establishing the CEA, the two most important parameters were included in the prediction of the CEA extent, Koc and biodegradation. These parameters are discussed briefly below.

B.1 Organic Carbon/Water Partitioning Coefficient (K_{oc})

The organic carbon/water partition coefficient (Koc) is defined as the equilibrium ratio of sorped compound per unit weight of organic carbon to the aqueous solute concentration. Sorption includes absorption and adsorbtion processes. This value indicates a compound's tendency to partition between water and particles containing organic carbon. The compound's Koc is useful in evaluating the potential of the compound to leach from contaminated solids and to migrate in the aquifer. Compounds with high Koc values tend to be immobile in organic rich soils and will be transported from contaminated areas only if the soil itself is transported. In the saturated zone, the migration of these compounds tends to be retarded with respect to the movement of the ground water.

The value of the log Koc reported for chlorobenzene is 2.35, which is higher than the reported value for benzene (1.69 to 2.00). The values for both compounds are relatively high and indicate that both benzene and chlorobenzene preferentially partition to organic matter. As a result, their migration will be retarded relative to the movement of ground water in the saturated zone. As evident from its lower Koc value, benzene will partition to the organic-rich site soil at a lesser rate than chlorobenzene.

B.2 Biotransformation

Biotransformation is the alteration of a compound through the action of organisms in the soil. Benzene and chlorobenzene are susceptible to transformation and degradation by microorganisms. During biodegradation, microorganisms transform available nutrients into forms useful for energy and cell reproduction by facilitating the transfer of electrons from donors to acceptors (a catalyzed redox reaction). This results in the oxidation of the electron donor and reduction of the electron acceptor. Electron donors include natural organic material and fuel hydrocarbons. Electron acceptors are elements or compounds that occur in relatively oxidized states. The more important electron acceptors in ground water include dissolved oxygen, nitrate, iron (III), sulfate, and carbon dioxide.

The biodegradation half-lives reported in "Handbook of Environmental Degradation Rates," by P.H. Howard et al. for the hydrocarbon constituents analyzed at the site are as follows:

Parameter	**Biodegradation Half-Life**			
	Soil		**Ground Water**	
	High	**Low**	**High**	**Low**
Benzene	16 days	5 days	2 years	10 days
Toluene	22 days	4 days	4 weeks	7 days
Ethylbenzene	10 days	3 days	8 months	6 days
Xylenes	4 weeks	1 week	12 months	2 weeks
MTBE	6 months	1 month	12 months	2 months
TBA	6 months	2 weeks	12 months	2 months

B.3 Site-Specific Parameters

Soil Fraction Organic Carbon (foc) Content: The organic carbon content of a soil is important for predicting the potential leachability of an organic compound from contaminated soils in the vadose zone, and any resulting retardation of the compound's movement relative to ground water flow through the saturated zone. Organic matter in the aquifer can also form a complex with dissolved metals and immobilize them, significantly reducing their mobility in the ground water.

Distribution Coefficient: The distribution coefficient, Kd, has been defined as the ratio of the mass of a compound adsorbed onto the solid matrix, to the concentration of the compound in solution. Kd is proportional to the fraction of organic carbon in the matrix (foc), and the compound's organic carbon/water partition ratio (Koc).

Ground Water Parameters and Geochemical Indicators of Biodegradation: Ground water parameters such as pH and dissolved oxygen content affect the rate and effectiveness of biodegradation of organic compounds. Dragun (1988) reports that most microorganisms will tolerate a pH range of 4.0 to 9.0, although most thrive in the pH range of 6.0 to 8.0. The pH in the ground water at the site is generally neutral, with an average value of 7.7, and has ranged from 6.2 to 9.2.

Biodegradation causes measurable changes in ground water geochemistry. Aerobic respiration reduces oxygen to water ratios, i.e. the dissolved oxygen concentration in the groundwater decreases. In anaerobic systems, where nitrate is the electron acceptor, the nitrate is reduced to NO_2, N_2O, NO, NH_4+, or N_2, and nitrate concentrations decrease. In anaerobic systems were iron (III) is the electron acceptor, iron (III) is reduced to iron (II), and iron (II) concentrations increase. In anaerobic systems where sulfate is the electron acceptor, sulfate is reduced to H_2S, and the sulfate concentrations decrease. In anaerobic systems where CO_2 is used as an electron acceptor, CO_2 is reduced by methanogenic bacteria to produce CH_4. During aerobic respiration, denitrification, iron (III) reduction, and sulfate reduction processes, total alkalinity will increase. If methanogenesis is the dominant terminal electron-accepting process (TEAP), alkalinity will remain fairly constant.

Fuel hydrocarbons biodegrade naturally when an indigenous population of hydrocarbon-degrading microorganisms is present in the aquifer and sufficient concentrations of electron acceptors and nutrients are available to these organisms. In most subsurface environments, both aerobic and anaerobic degradation of fuel hydrocarbons can occur, often simultaneously in different parts of the plume depending primarily on the amount of dissolved oxygen in the ground water. At the M-2 Landfill, the sand fill and/or clayey/silty horizons appear to be the sources of electron acceptors and nutrients, and therefore are preferred by acclimated bacteria.

Dissolved Oxygen: Aerobic respiration is the first reaction in an aerobic environment that contains microorganisms capable of aerobic respiration (i.e., obligate aerobes or facultative anaerobes) (Bouwer, 1992; Chapelle, 1993). Once the available dissolved oxygen (DO) is depleted and anaerobic conditions dominate the interior regions of the hydrocarbon plume, facultative or obligate anaerobic microorganisms can utilize other electron acceptors in the following order of preference: nitrate, manganese, iron (III), sulfate, and finally, carbon dioxide. As each electron acceptor being utilized for biodegradation becomes depleted, the next most

preferable electron acceptor is utilized. Each successive redox couple provides less energy to the microorganism.

The reported DO concentrations are measured after well purging, as these conditions are considered more representative of ground water at a remote distance from the well. Data collected from monitoring wells show that areas with elevated benzene-chlorobenzene values have depleted the DO concentrations to approximate 2.0 mg/L. The background levels of DO at the up-gradient and side-gradient wells are between 6.0 mg/L and 9.0 mg/L. This indicates that aerobic biodegradation of benzene and chlorobenzene is occurring in this area. Based on DO readings site-wide, aerobic biodegradation also is occurring downgradient towards the margins of the groundwater plume in the area of wells installed near Mill Creek.

Aerobic degradation requires the presence of free dissolved oxygen. If the subsurface environment becomes devoid of oxygen, the rate of aerobic biodegradation will typically be limited by oxygen supply rather than by nutrient concentration. For anaerobic biodegradation the microbial competition ultimately will determine the dominant process, but the dominant process can vary both temporally and spatially. Therefore, either iron (III) reduction, sulfate reduction or methanogenesis may dominate depending on seasonal variations in concentrations of dissolved oxygen and sulfate.

Using stoichiometry, a utilization factor can be developed showing the ratio of the oxygen consumed to the mass of dissolved hydrocarbon degraded in the biodegradation reactions. Similarly, utilization factors can be developed to show the ratio of the mass of metabolic by-products (such as ferrous iron) that are generated to the mass of dissolved hydrocarbon degraded in the biodegradation reactions. When the available electron acceptor/by-product concentrations are divided by the appropriate utilization factor, an estimate of the biodegradation capacity of the ground water flowing through the source zone and plume can be developed as follows:

Biodegradation Capacity (mg/L) =
{(Average Upgradient Electron Acceptor Concentration) -
(Minimum Plume Zone Electron Acceptor Concentration)} / Utilization Factor

The following utilization factors and site biodegradation capacities, based on the degradation of benzene, are calculated for the site:

lectron cceptor	Site Av lable Electron Acceptor		Most of the Site		MW-04	
	Most of the Site (mg/L)	MW-04 (mg/L)	Utilization Factor (mg/mg)	Site Bio egradation Cap city (mg L)	Utilization Factor (mg/mg)	Site Biod gradation Capa city (mg/ .)
Oxygen	2	3	3.14	0.63	3.14	0.96

The highest benzene concentration observed in October 1998 at the MW-09 location was 0.538 mg/L (March 2000 sampling event indicated only 2.21 mg/L). Based on the calculations

presented in the preceding table and on site observations, ground water has enough biodegradation capacity to degrade dissolved-phase benzene-chlorobenzene, if aerobic reactions are occurring at the site (i.e. the minimum calculated site biodegradation capacity of 0.63 mg/L is greater than the highest benzene/CB concentration observed at the site (0.538 mg/L)).

The results of the extensive ground water monitoring program show that VOC concentrations have either decreased over time or do not migrate off-site. The fact that there is no increase in concentrations of the contaminants detected above the GWQC over time indicates that no new sources of contamination have impacted the ground water at the site.

Since the establishment of the CEA is based on current ground water conditions and a prediction of future ground water conditions, Versar used the two most recent rounds of analytical data to develop the parameters for the CEA.

IV. EXTENT OF THE CEA

The horizontal and vertical extent of the CEA is identified by the analysis of existing data to determine the probable maximum extent of future contamination at concentrations above the GWQC. This CEA proposal includes fate and transport modeling that predicts the future attenuation and migration of contaminants.

The results of the monitoring program at the M-2 Landfill show that the ground water contaminant plume is relatively stable (**Table 2A-2E, Figures 5A, 5B, 6A, 6B, 7A and 7B**).

Based on the data, and on the fate and transport model performed for the site, Versar predicts that the maximum extent of contamination in the future will not be materially larger than the current extent of contamination.

Figures 10A and 10B present the current maximum horizontal extent of contamination at concentrations above GWQC based on the analytical data provided in **Table 2A** through **2E**, and based on the fate and transport model performed for the site (**Appendix H.1**). The vertical extent of contamination is defined as the maximum depth at which ground water contamination was detected at the site at concentrations above the GWQC. In this case, the maximum vertical depth of the CEA is 50 feet bgs based on benzene concentrations collected from Well MW-11.

V. DURATION OF THE CEA

The CEA duration represents the length of time in which natural remediation will reduce the VOC concentration in ground water to levels lower than the required GWQS. Based on the groundwater fate and transport model performed for the site it is estimated that the length of the CEA will extent up to the year 2009 for chlorobenzene (Well MW-2) and up to year 2004 for benzene (Wells MW-2 and MW-9).

VI. WRITTEN AND MAPPED DESCRIPTION OF THE CEA

Figures 10A, 10B and 11 show the proposed horizontal extent of the CEA. As indicated on these figures, the entire CEA is located on-site (i.e. within the physical boundaries of the M-2 landfill).

For purposes of mapping in the NJDEP Geographic Information System (GIS) database, the horizontal extent of the CEA is defined as the area within the perimeter of the following points (in New Jersey State Plane Coordinates):

North: X – 617145.69, Y-538241.85
East: X – 617224.23, Y-538085.43
South: X – 616250.05, Y-537575.04
West: X – 616106.32, Y-537769.11

An electronic copy of the map of the CEA is provided as an attachment to this proposal.

The vertical boundary of the CEA is defined by the maximum depth at which ground water contamination was detected at the site at values above the GWQC. In this case the maximum vertical depth of the CEA is 50 feet bgs based on benzene concentrations collected from Well MW-11.

VII. GROUND WATER USE AREA DETERMINATION

The NJDEP guidance concerning CEA applications requires the applicant to determine if the proposed CEA is in a ground water use area. A ground water use area is defined by NJDEP as an area where "domestic, irrigation, industrial or public supply wells, or wells with water allocation permits already exist or there is a reasonable expectation that they will be installed within the 25-year planning horizon."

As previously noted, the proposed CEA extends within the site boundary of the M-2 Landfill. Versar believes that there are no current users of ground water in the proposed CEA area, nor are they expected over the next 25 years. Therefore, Versar concludes that the proposed CEA is not located in a ground water use area.

VIII. NOTIFICATION OF APPROPRIATE AUTHORITIES

In accordance with NJAC 7:26E-6.2(a) 17, the DPW will notify the local health department and the Eatontown City Clerk in writing of their intent to establish a CEA. A copy of the notification letter and the certified mail receipt, indicating that it was received by the said parties, will be forwarded to the NJDEP approximately one month after this proposal has been submitted to the NJDEP. In addition, public notice of intent to establish a CEA will be placed in a local newspaper with a wide distribution for this area.

NOTES

Only detected compounds are listed.

All concentrations are given in micrograms per liter (ug/L), equivalent to parts per billion (ppb).

* Regulatory level shown is higher of PQL and Ground Water Quality Criteria as per NJAC 7;9-6

Exceedances of the NJDEP GWQC are highlighted and printed in **bold-faced** type.

D = Results are from a Dilution of the Sample

J = compound Identified Below Detection Limit

ND: Not Detected

NLE: No regulatory limit has been established for this parameter.

PQL: Practical Quantitation Limit

NOTES

Only detected compounds are listed.

All concentrations are given in micrograms per liter (ug/L), equivalent to parts per billion (ppb).

* Regulatory level shown is higher of PQL and Ground Water Quality Criteria as per NJAC 7;9-6

Exceedances of the NJDEP GWQC are highlighted and printed in **bold-faced** type.

D = Results are from a Dilution of the Sample

J = compound Identified Below Detection Limit

ND: Not Detected

NLE: No regulatory limit has been established for this parameter.

PQL: Practical Quantitation Limit

NOTES

Only detected compounds are listed.

All concentrations are given in micrograms per liter (ug/L), equivalent to parts per billion (ppb).

* Regulatory level shown is higher of PQL and Ground Water Quality Criteria as per NJAC 7;9-6

Exceedances of the NJDEP GWQC are highlighted and printed in **bold-faced** type.

D = Results are from a Dilution of the Sample

J = compound Identified Below Detection Limit

ND: Not Detected

NLE: No regulatory limit has been established for this parameter.

PQL: Practical Quantitation Limit

Only detected compounds are listed.
All concentrations are given in micrograms per liter (ug/L), equivalent to parts per billion (ppb).
* Regulatory level shown is higher of PQL and Ground Water Criteria (GWQC) as per NJAC 7:9-6.
Exceedances of the GWQC are highlighted and printed in **bold-faced** type.
ND: Not Detected

APPENDIX H.1

Determination of the Extent and Duration of the CEA

A. Components of the Model

In determining the extent and duration of the Classification Exception Area (CEA) for the M-2 Landfill, the NJDEP's analytical solution option (1998) was used. In the model, the source is assumed to be located at the well of interest. Initial concentrations at the wells of interest are assumed to be equal to the average concentrations of the two-most recent rounds of ground water quality sampling events at the M-2 Landfill (June and August 1999). Since the model assumes a uniform flow - isotropic and homogeneous and a known flow direction, the CEA area is semi-circular in plan view.

Species migrate away from the wells of interest at a rate that is primarily governed by advection. The model used is conservative since it does not account for species attenuation by hydrodynamic dispersion and adsorption but only by biodegradation. In the model, biodegradation is represented by a first-order decay process in accordance with the biodegradation half-life of each species. The key assumptions used in the model are as follows:

- The aquifer is homogeneous and isotropic.
- The ground water velocity is uniform and constant.
- The biodegradation rate is proportional to concentration and may be represented by a first-order biodegradation rate expression.

To be conservative, constituent losses through molecular diffusion, hydrodynamic dispersion and volatilization are neglected.

B. Input Parameters

The model relies on site-specific data for parameter input values. The model input data are described below.

1. First Order Decay Constants

The first order decay constants describe the rate at which compounds are biodegraded in the aquifer. They are determined in laboratory and field experiments, and are specific to each compound. Decay constants are in units of 1/time. The decay constants are related to the half-lives as described in the following equation.

Decay constant = ((ln 0.5)/half-life) = (0.693/half-life)

The model requires first order decay constants. The decay constants were derived from well-specific measured concentrations. The derived well-specific decay constants were compared to field and laboratory studies of biodegradation of the VOC of interest that were published in the scientific literature, to ensure that they are either conservative or within the published range. Table A-1 to A-3 present constituent/well-specific biodegradation rates calculations. In case in which data were not representative, a literature value was used (Howard 1991).

calculations. In case in which data were not representative, a literature value was used (Howard 1991).

2. Uniform Ground Water Seepage Velocity

The uniform ground water seepage velocity is calculated from Darcy's law as:

$$V_s = K * i/n_e$$

Where:
V_s = seepage velocity;
K = hydraulic conductivity;
i = hydraulic gradient; and
n_e = effective porosity.

The hydraulic conductivity has units of length/time, and the hydraulic gradient and effective porosity are dimensionless, so the seepage velocity has units of length/time.

The hydraulic conductivity obtained from the pump test was used, since the value is more conservative. The hydraulic gradient was determined for the aquifer based on the ground water elevations measured in 1998 (see Table 1 and Figures 4A and 4B). An effective porosity of 0.01 was used in the model for the aquifer. This value represents the geometric mean of the range (0.001 – 0.1) published by Storch Engineers in 1987 for the M-2 Landfill.

3. Retardation Factor

The retardation factor is a dimensionless parameter that describes the effect of chemical adsorption on the aquifer material. This process slows the migration of dissolved chemicals in ground water. The retardation factor is calculated as:

$$R_d = 1 + (K_{oc} * f_{oc} * \tilde{n}_b/n_e)$$

Where:
R_d = retardation factor;
K_{oc} = soil sorption coefficient;
f_{oc} = fraction of organic carbon;
$\tilde{n}_b$ = bulk density of formation; and
n_e = effective porosity.

Literature values were obtained for these parameters. The soil sorption coefficient is compound-specific and is expressed in units of milliliters of solute per gram of aquifer material (USEPA 1996b). The fraction of organic carbon of 0.003 was used in the model as recommended by the USEPA (1996a) for the sites at which no specific data are available. The bulk density values were obtained from a range of values for similar geologic materials (USEPA 1985). The effective porosity was selected as described above.

B. Modeling Results

Table A-9 summarizes the results of the ground water modeling. Tables A-1 to A-5 present biodegradation estimates and Tables A-6 to A-8 present detailed CEA calculations for each well of concern at the M-2 Landfill. Graphical depictions of the model output for each contaminant from each source well for which concentrations are higher than the NJDEP GWQC are provided in Figures A-1 through A-3. These results and their relationship to the proposed CEAs are discussed in the text of the report.

CEA will extend until approximately:			
3,300	**January 3, 2009**	**0.39**	**3.73**
NJGWQC	**mg/L**	**1**	**4**

Notes:

NJGWQC = New Jersey Ground Water Quality Criterion

Parent Constituent Predicted Concentration: $C_p(t) = C_p(t-1) * e^{-k\Delta t}$

Daughter Constituent Predicted Concentration: $C_d(t) = C_d(t-1) * e^{-k\Delta t} + (Cp(t-1)-Cp(t))*Md/Mp$

Time to reach NJGWQC = T_{NJGWQC}

Reaction Rate Constant = $k = -\ln(0.5)/t_{1/2}$

Length of CEA Based on Available Site Specific Biodegradation Rates

Input Data

Hydraulic Conductivity[3] (K)	cm/s	1.41E-04	
Hydraulic Gradient[4] (i):	ft/ft	0.03	
Effective Porosity[5] (n_e):	---	0.4	
Bulk Density of Formation[5] (r_b)	kg/L	1.5	
n-Octanol/Carbon Partition[6] (K_{oc}):	L/kg	61.7	224
Fraction of Organic Carbon[7] (f_{oc})	---	0.003	

Calculation and Results

Seepage Velocity (ft/day)	vs = K*i/ne =	0.03	
Retardation Factor	Rd = 1 + (Koc * foc* rb / ne) =	1.73	3.66
Pollutant Transport Rate (ft/day)	vpt = vs/Rd =	0.017	0.008
or (ft/year)		6.32	2.99
T_{NJGWQC} (days)	Determined above	1,800	3,300
T_{NJGWQC} (years)		5	9
Length of CEA (ft)	vpt * TGWQS =	31	27

Notes:

(1) Initial concentration (Co) is the average concentrationof the last two sample event.

(2) Half-Life data reference: Howard, P.H. et. al. 1991. *Handbook of Environmental Degradation Rates*. Lewis Publishers.

(3) Hydraulic conductivity, K = 0.4 ft/day (pump test performed by Versar in August 2000)

(4) Hydraulic gradient (i) derived by Versar (August 2000) from ground water elevation contours

(5) Effective porosity, n = 0.4, and bulk density, ρ_b = 1.5 g/mL (consistent with the type of soil - clayey sands, at the Site).

(6) K_{oc} data reference: Soil Screeening Guidance 1996.

(7) f_{oc} = 0.003 (the geometric average of the minimum and maximum range of f_{oc}). *USEPA 1996* .

Table A-9
Results of Ground Water Modeling for Determination of CEA Duration and Extent
M-2 Landfill

Chemical	Initial Concentration	NJDEP Ground Water Quality Standard	Results	
			Duration[1]	Approximate Distance[2]
	(mg/L)	(mg/L)	(years)	(feet from the source well)
Overburden				
MW-2				
Benzene	3.135	1	5	31
Chlorobenzene	30.15	4	**9**	**27**
MW-3				
Benzene	0.795	1	0	0
Chlorobenzene	7.31	4	3	8
MW-9				
Benzene	3.06	1	5	30
Chlorobenzene	ND	4	0	0

Notes:

1 - Duration is the time required for the VOC concentration in all parts of the plume to meet the NJ Ground Water Quality Standards

2 - Distance is the distance downgradient from the source well at which the concentration will never exceed the NJ Ground Water Quality Standards.
