- Estimates of the cost per public school child (net of State and Federal transfers) to both the local District School (elementary and middle schools) and the Regional High School District.
- Ratio of total residential property assessed value to total commercial property assessed value as the basis for allocating public service costs to new residents and employees.

ERA provides a summary of the underlying data sources, assumptions, and other factors that support an estimate of the potential incremental public service costs that could result in Year 10 and Year 20 of the proposed Fort Monmouth redevelopment in the following section.

Population, Households, and Employment

ERA relied upon proprietary 2008 data reported by ESRI Business Information Solutions, a demographic and economic forecasting company to develop estimates of current residential and commercial populations in each jurisdiction. For the purpose of estimating average household size as the basis for projecting new residents resulting from the proposed housing program, ERA assumed the current average household size reported for all unit types. ERA considers this approach to be conservative because multifamily housing units typically are associated with smaller than average household size. As such, the estimated new residential population and residential public service costs are likely overstated. A summary of ERA's residential population estimates in Year 10 and Year 20 of buildout is provided in the following table.

Table 10: Estimated Residential Population

EATONTOWN	Housing Units			Persons / HH	New Residents		
	Year 10	Year 20	Total		Year 10	Year 20	Total

Employment Generation Factors

ERA's estimates of new employment that would be created by the reuse of existing commercial buildings and the construction of new commercial property is based on employment generation factors published by ULI-the Urban Land Institute's Dollar and Cents of Shopping Centers and ULI's Dollars and Cents Multifamily Housing. A summary of the employment generation factors and projected employment yield associated with the proposed plan is located in Appendix Table B-1.

Local Fund "Appropriations" (Operating) Cost Factors

ERA evaluated the standard form New Jersey 2008 Municipal Budget for each jurisdiction that will be impacted by the reversion of the Fort Monmouth site to the localities. For the purpose of calculating per capita marginal cost factors, ERA focused on the "Current Fund – Appropriations" (operating) budgets for FY2008 as the basis for estimating the potential incremental costs associated with providing municipal services to current and projected residents and employees. Specifically, ERA included 100 percent of the "Current Fund – Appropriation" costs detailed on budget sheets 12 through budget sheet 17 (refer to Appendix B-2 for detailed summary of appropriations line items included in the public service cost analysis).

ERA determined that typically, more than 50 percent of each Borough's operating budget is dedicated to staffing and wage costs. However, based on interviews with the Chief Financial Officers or Borough Administrators of each of the localities, ERA concluded that the residential and commercial uses proposed by the Fort Monmouth plan would not require a significant increase in current municipal staffing levels. Based on ERA's experience in similar communities, ERA applied a cost burden factor of 20 percent to salaries and wages. ERA determined that other annual ongoing expenses (variable operating costs) would be directly impacted by an increase in residential and commercial activity in each jurisdiction. ERA applied a cost burden factor of 100 percent to these expenses, such as utilities, equipment repair and maintenance, machinery supplies, and motor fuel.

Finally, ERA evaluated the relative cost burden of residential and commercial populations in each jurisdiction. This step is typically calculated by evaluating the relationship between the total assessed value of residential versus commercial property. ERA obtained estimates from each jurisdiction regarding the relative weight of the residential and commercial values as the basis for performing the allocation calculations detailed in the following series of tables. (Note: ERA will update this analysis to reflect actual assessed values as more accurate and up to date assumptions are made available.)

The estimated residential cost value was then divided by total residential population to yield the residential per capita public service cost value and the estimated commercial cost value was then divided by the total commercial population to yield the estimated commercial per capita cost value, as defined by the proposed development program outlined in the appendix to this report. These values were then multiplied by the estimated new residential and commercial populations that are expected to result from the proposed Fort Monmouth plan to develop the total public service cost impact to each jurisdiction.

Utility Fund Expenditures

Based on discussions with individual jurisdictions, the majority of new residential and commercial property will likely be served by fee-based public utility services. Accordingly, these items are considered "revenue neutral" and are excluded from the analysis.

Civic Uses

The proposed Fort Monmouth plan includes a variety of civic uses that are proposed to revert to the Boroughs or non-profit uses, or be sold for private operation. For those uses that are intended for continued public use, existing and proposed properties may require upfront capital investment for acquisition or renovation. Costs estimates for the majority of these properties were not available. ERA concludes that an estimate of the one-time capital cost impact to the Boroughs will require further evaluation. A summary of the civic uses as currently allocated to each jurisdiction follows.

Eatontown

- Eatontown Municipal Center Malette Hall
- Public Theater
- Gibbs Hall Suneagles Golf Club (Acres)
- Fort Monmouth Jitney Bus

Oceanport

- Barker Circle Oceanport Municipal Complex
- Kaplan Hall Museum
- Public Marina
- Counseling Center
- Library
- Armstrong Hall Education Building
- Lane Hall Community Conference Center
- Recreation Support Building
- Fire/Emergency Services Station
- Chapel
- VA - Community Medical Center
- Main Post Office
- Middle School (450 students, 16-acres)

Tinton Falls

- Child Development Center
- Recreation Center (formerly Teen Center)
- Fire/Emergency Services Station
- Community Pool/Tennis Center(s)
- Fire & Police Training Academy
- Library

Public School Education Estimates

Public school education costs are based on current costs per pupil reported by local and regional school district budgets. Public school child generation factors are based on the Quick Guide to New Jersey Residential and Demographic Multipliers (Listokin, Bloustein School of Planning and Public Policy, November 2006). Note that ERA includes only local costs per pupil (net of costs funded by State and Federal sources). The following series of tables summarizes ERA's assumptions regarding the potential cost of public school education that could result from new school children living within the Fort Monmouth site.

8.4 Conclusion

ERA's analysis concludes that the proposed physical development Plan would generally result in positive fiscal impacts for the jurisdictions analyzed. The net fiscal impact to the municipal operating, local school district, and regional high school district funds are generally quite favorable.

9.0 ZONING & LAND USE IMPACTS

9.0 Zoning & Land Use Impacts

9.1 Statement Of Goals and Objectives

The following Goals and Objectives have been developed to guide the preparation of this plan:

To create a "green community" model where sustainable redevelopment at Fort Monmouth balances the economic, environmental and social triple bottom line within the limits of available resources.

To plan for beneficial redevelopment that improves and reinforces the quality of life in the constituent municipalities consistent with State, County & Municipal planning policy, by:

- Creating Mixed-Use Live/Work/Leisure Centers;
- Linking centers & increasing local and regional mobility with connected transit infrastructure serving the region and the Fort;
- Enhancing auto mobility and redevelopment capacity with targeted roadway improvements;
- Establishing a continuous Blue – Greenbelt combining active and passive open space, wildlife habitat, riparian corridors and wetlands;
- Enhancing bicycle & pedestrian mobility throughout the Fort and adjoining areas utilizing the Blue - Greenbelt to maximize linkages; and
- Eliminating perceived Fort boundaries and connecting proposed and existing land uses to reintegrate the Fort to the communities

To promote the efficient and comprehensive conversion and revitalization of Fort Monmouth and leverage existing Fort Monmouth assets, by

- Reusing, adapting, replacing or upgrading the Fort Monmouth buildings
- Stabilizing and growing the high-tech workforce in the region and managing job replacement & employee training
- Retaining jobs and creating new employment and other business opportunities
- Attracting and supporting NJ growth industries (Communications, renewable energy, life science, nanotech, stem cell, homeland security)

To promote a balance of land uses and varied housing types (including Homeless, COAH & Workforce housing) that meets regional needs and promotes municipal fiscal health.

9.1.1 Current Local Land Use Policies

Eatontown

A July 23, 2007 update of the Eatontown Master Plan incorporated the results and recommendations of Borough planning studies on the reuse of Fort Monmouth and the future of the downtown Village area of the Borough. The Planning Board also updated the statement of relationship of the Borough plan to the plans of adjoining municipalities, the County and the State. Two of the goals of the Master Plan that relate to Fort Monmouth included:

- To design and implement the road plan of the Borough to facilitate the movement of residents from one quadrant to others without using Routes 35 and 36 or the Route 35/Route 36 intersection; to discourage traffic from outside the Borough from using streets internal to residential areas; and, to assure that adequate parking is provided by all new developments.
- To support the commercial and industrial attractiveness of the Borough by facilitating continued viability of existing commercial development along Routes 35 and 36, and additional and upgraded development on vacant land within existing commercial areas.

As part of the reuse and redevelopment of Fort Monmouth for civilian activity, the Borough Master Plan recommends the following:

a. Relocate the Borough municipal complex onto Fort Monmouth to reoccupy the Fort Monmouth Life Cycle Management Building as the new Borough municipal complex.

b. Adopt the recommendations of the Howard Commons Reuse Study prepared February 2003 by Kise, Straw and Kolodner. The Howard Commons study is appended to the Borough Master Plan and adopted by reference as the Borough plan for the reuse of the Howard Commons area of Fort Monmouth.

c. Endorse the public benefit conveyance of surplus property at Fort Monmouth for park and recreation purposes as recommended by Monmouth County in the County notice of intent dated February 14, 2007.

The Land Use Plan identified Federal government lands at Fort Monmouth as the "Fort Monmouth Reuse Planning Area" on the Master Plan map. These lands are included in the zone plan as part of the P-1 zone for public use.

The Land Use Plan recommends that the Howard Commons Area of Fort Monmouth be redeveloped and reused in accordance with the recommendations of the Howard Commons Reuse Study prepared February 2003 by Kise, Kolodner, and Straw. The Howard Commons planning area is shown on the Borough Master Plan map and the Howard

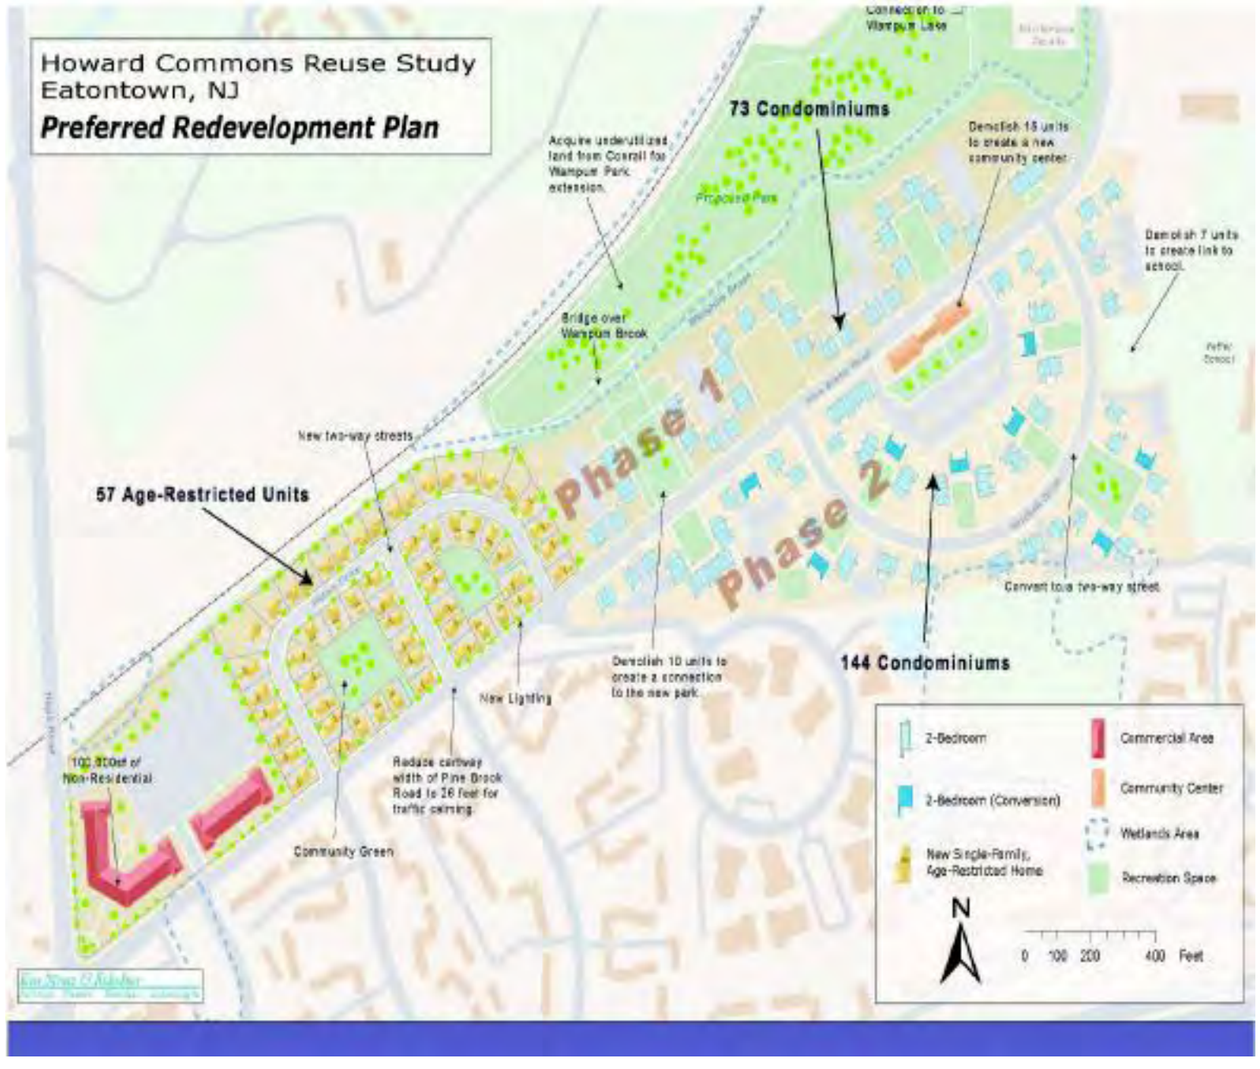
Commons Reuse Study is appended to and adopted as part of this Borough Master Plan.

The Eatontown plan also recommends that the Fort Monmouth reuse plan should provide for the relocation of the Borough municipal complex from Broad Street into the Fort Monmouth Life Cycle Management Building. The Borough Master Plan map shows the location of the Life Cycle Management Building as the proposed location of the Borough municipal building.

Eatontown advances the concept that the Fort Monmouth reuse plan should provide for reuse of land within the base as park and recreation land as recommended by the February 14, 2007 notice of public interest by Monmouth County for the conveyance of surplus property for park and recreation use. Three recreation parcels are located in Eatontown, including Husky Brook Lake and the football complex; Lefetra Creek, Parkers Creek and Mill Creek, the baseball/ softball fields and bowling center; and the base golf course.

The Borough Master Plan map shows the location of the proposed Fort Monmouth Park and recreation land. A description of the proposed use of each of the three open space and recreation parcels is included in the Borough's Open Space, Recreation, and Conservation Plan Element.

The Eatontown plan also recommends that Tinton Avenue (CR 537) should be extended as a through street across the base from Route 35 eastward to Oceanport.



Oceanport

From Fort to Village: A Vision for Oceanport's Fort Monmouth is a plan for redevelopment of the Ft. Monmouth property in Oceanport. Intended as a demonstration of the principles of smart growth set forth in the New Jersey State Development and Redevelopment Plan, new development would be compact, walkable and bikeable.

Natural features of the site including wetlands and waterfronts would be preserved and upgraded, and new development would conserve energy by being designed in accordance with the LEED standards for neighborhood development.

Two of the goals of the Oceanport Plan that relate to Fort Monmouth include:

- Creating employment opportunities and commercial ratables is one of Oceanport's major objectives. The existing McAfee Center is one of the most modern office space structures on the base and would lend itself to the conversion to commercial office space.

Overall Concept Plan

- The creation of a series of public space that integrate all of these elements together in order to produce a community framework that embodies sustainable principles of community development. These components would be comprised of existing natural areas as well as built areas.

From Fort to Village finds that the open spaces within Fort Monmouth are largely based on the existing unique natural attributes. These include the coastal fringes, freshwater wetlands, and stream corridors associated with Parker's and Oceanport Creeks, branches of the Shrewsbury River. Areas identified as bald eagle habitat and the existing marina are integral to this network, which also includes the existing ponds and recreational lands, as well as those open lands identified for public benefit conveyance by Monmouth County Parks. Oceanport's plan envisions the integration of existing contaminated lands within the open space network, where they may be contained while contributing to the framework of open spaces.

The following is a summary of the specific recommendations of the Oceanport Vision Plan:

a. The open space requested by the Monmouth County Parks Department, including the historic parade ground and the environmentally sensitive land along Oceanport Creek and Parker's Creek, would become dedicated public property. This land would serve as open space for both the Fort development and surrounding neighborhoods.

b. The Fort Monmouth Historic District would be preserved and structures within the district would be restored and reused in accordance with the Secretary of the Interior Standards.

c. The 98 acres between Oceanport Avenue and the NJ Transit tracks would be developed as a mixed-use, small scale,

age Center Concept Plan

walkable village. Oceanport Avenue would be developed as a boulevard and provide the major North-South traffic route for Oceanport development.

d. The Patterson Medical Center would be maintained as a veterans health facility and the land close to the Center would be developed with a mix of health care providers and professional offices. This area would also provide sites for an elementary and a middle school located next to County open space.

e. The Oceanport Board of Education has requested the conveyance of the McAfee Center. If it is not used by the B.O.E., then McAfee Center and the surrounding property are seen as well suited to be developed as an office campus.

f. The 28 acres along Parker's Creek is a prime waterfront development site that calls for the highest design quality with a unique resort hotel, spa, and/or conference facility.

g. Redevelopment of Ft. Monmouth would require the creation of an east-west arterial street in order to connect the proposed development areas with Rt. 35 and the regional highway system. The new east-west street should be designed to be compatible with the historic district and connect with Oceanport Avenue.

h. The vision plan envisions that there would be a jitney or small bus system connecting the various development centers at the Fort with the Little Silver train station. Since jitneys are generally small-capacity vehicles that follow a service route, but can divert to pick up and drop off passengers, the jitney would serve as an important link to the NJ Transit rail system. Such a system would also allow commuters from outside the area to access jobs located within the redevelopment area.

Medical Office Park Concept Plan

Tinton Falls

Public land parcels represent the single largest land category, including 3,249 acres or nearly 33% of Tinton Falls's total land area. The three largest publicly-owned sites - Naval Weapons Station Earle (approximately 1200 acres), Fort Monmouth (approximately 170 acres), and the Monmouth County Reclamation Center (approximately 900 acres) – are dominant land uses in Tinton Falls, with other publicly-owned parcels such as schools and open space scattered throughout the Borough.

One of the goals of the Tinton Falls Master Plan is to ensure the most appropriate reuse of Fort Monmouth. The Borough's objectives for land use include being actively involved in the planning process for the redevelopment of Fort Monmouth in order to ensure the most appropriate and beneficial reuse of the site.

Goals for housing include the objective of fully integrating affordable housing throughout the Borough, both within development projects and geographically throughout Tinton Falls.

Tinton Falls land use policies regarding Fort Monmouth are summarized below.

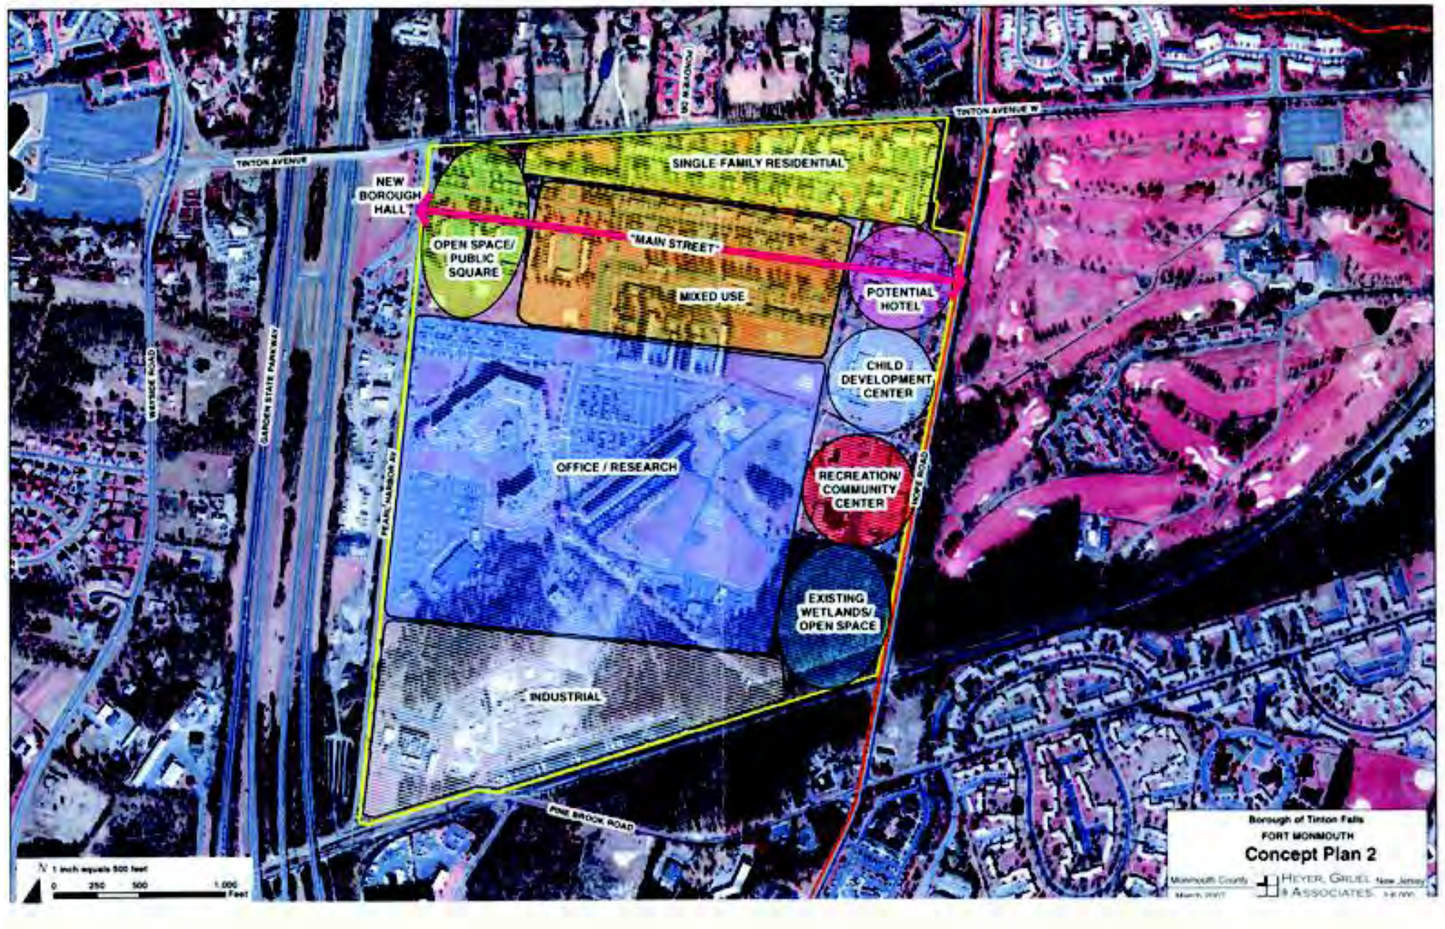
a. Fort Monmouth would become private land under statutory provisions that give the Borough limited ability to regulate the land use of the parcel. However, Tinton Falls sees this property as the last and best opportunity to create something special for the Borough, and seeks to advance its vision for the ultimate development of the site.

This vision is graphically shown on the Concept Plan map for Fort Monmouth that assumes a variety of uses, some public, some of which may be private. For example, the County may have an interest in the Fire Academy and other public uses on the site. The remainder of the site should be carefully developed, if it becomes available.

b. Sensitivity to the development of Tinton Avenue West is a principal concern.

- The properties to the north of Tinton Avenue adjacent to Fort Monmouth are within the Borough's RA Residential Agricultural designation, the lowest intensity zone within the Borough. The roadway is also designed as a scenic corridor by the County.

- The uses of Fort Monmouth lands along the Tinton Avenue frontage should be restricted to either very low intensity uses or buffering along the road. New curb cuts and significant traffic generators should not be located adjacent to Tinton Avenue.



- The central core of the Fort Monmouth site has great potential to serve as Tinton Falls' Town Center and the Borough hopes to create a new "Main Street" development running westward from Hope Road and terminating at the municipal complex adjacent to the Parkway. Along this Main Street and on the balance of the tract, a compact mixed-use, walking scale community could be developed. The Town Center should include a substantial commercial component as well as residential development, entertainment uses, and well defined public spaces including a possible new Library.

- Linkages to the neighborhoods of Tinton Falls should be carefully considered. The Town Center should also accommodate affordable housing. Consideration should be given to development of a hotel.

- A significant open space component should be included which can also connect the activity centers within the site and preserve the site's environmental features.

9.1.2 Comparison of Fort Monmouth Concept Plan and Local Plans

The following analysis identifies by municipality how the proposed concept reuse plan for Fort Monmouth compares with the local plans described above.

Oceanport (Proceeding from east to west on concept plan)

a. Concurrence

1. Medium density housing between NJ Transit line and Oceanport Ave.
2. The land areas along Oceanport Creek and Parker's Creek would be developed as natural open spaces
3. Marina
4. Mixed use retail/housing around Oceanport Ave.
5. Historic Parade Ground and surrounding structures preserved
6. Mixed Use resort/cottage retail along Parkers Creek (Borough refers to it as Riverfront Resort Development area)
7. Ecotech Park or McAfee Corporate Center - agreement except for name

b. Open

1. Municipal Complex - Borough plan includes it as part of the mixed-use area, while the FMERPA plan locates this facility at Barker Circle, where the Borough plan indicates University residences and fire station or municipal uses
2. Paterson Army Health Clinic, school - Oceanport proposes townhouses and professional offices (medical) while FMERPA Plan calls for a medical office building, apartments, townhouses and a limited number of detached small lot homes.
3. Homeless accommodations
4. The FMERPA Plan calls for single-family detached housing across the street from similar housing on Main Street.
5. Thoroughbred training and stabling facility (Oceanport Resolution #R-08-97 adopted June 19, 2008)

Eatontown

a. Concurrence

1. Howard Commons Area – this area is intended for housing in both Borough's and FMERPA's concept plans.
2. Relocate Borough administrative offices to the Mallette Hall.
3. Tinton Avenue (CR 537) should be extended as a through street across the base from Route 35 eastward to Oceanport
4. Open space areas

b. No Comments or acknowledgement

1. Hotel and conference center
2. Commercial incubator, community center retail and housing in Master Plan (there is a town center identified in the Howard Commons report)
3. Homeless accommodations

c. Open

1. Howard Commons Area – type of housing - FMERPA Plan calls for courtyard apartments and is silent on ownership and age restriction, while the Borough plan calls for age-restricted housing and condominiums

Tinton Falls

a. Concurrence

1. Town Center "Main Street" is identified in FMERPA Plan and Borough's concept plan
2. Commercial/general office
3. Open space to the east

b. Open

1. Homeless accomodations

9.2 Municipal Zoning Initiatives related to Fort Monmouth

The FMERPA plan development process would include public meetings with municipalities regarding the plan, which would provide a forum for communicating municipal positions on the base redevelopment. A formal procedure mandated as part of the FMERPA planning process requires a review of the draft FMERPA plan by municipal planning boards and comparison to the municipal Master Plan:

C.52:27I-15 Submission of proposed plan to constituent municipalities.

15. Prior to the adoption of the plan, or revision or amendment thereto, the authority shall transmit a copy of the proposed plan to the planning board of each constituent municipality. Within 45 days after referral, each planning board shall transmit to the authority a report containing its recommendation concerning the plan. This report shall include an identification of any provisions in the proposed plan that are inconsistent with the master plan and recommendations concerning these inconsistencies and any other matters as the board deems appropriate.

The host municipalities have indicated the following local zoning preferences for implementation and their implications:

Eatontown

Pending the finalization of a reuse plan for Fort Monmouth and the adoption of a redevelopment plan for Eatontown Village, no other zone changes are being recommended at this time to implement the land use element.

Oceanport

With the completion of the ***Fort to Village Plan: A Vision for Oceanport's Fort Monmouth***, Oceanport has articulated its vision for the redevelopment of the 419 acres of Fort Monmouth that lie within its boundaries. However, this plan does not represent the end of the process. As FMERPA proceeds through the development of the plan for the Fort, the ***Fort to Village Plan*** may be used by Oceanport to inform the FMERPA plan process and other regional and state planning initiatives.

The inclusion of the ***Fort to Village Plan*** in the local Master Plan would provide that the required referral and review by the Planning Board would capture the principles and concepts contained in the Concept Plan. Ultimately, the entire Master Plan should be updated to reflect the vision for Fort Monmouth.

Tinton Falls

Tinton Falls includes most lands on Fort Monmouth within the IOP Industrial/ Office Park Districts (IOP-10, IOP-15, IOP-20, IOP-25, IOP-35, and IOP-50). The IOP zones permitted and conditional uses are as follows:

1. Permitted uses include offices; hotels and motels; research facilities; hospital; veterinary hospitals; utilities; restaurants; restaurants with bar; manufacturing; fabrication and assembly operations; agricultural uses but not "farms"; tennis courts, gymnasiums, weight rooms and exercise centers; instructional centers; golf courses, parks, and other open space uses; elementary, middle, and high schools offering academic instruction with curriculums approved by the elementary and/or regional boards of education; retail/ warehouse uses, lumber yards, and home improvement centers; Borough uses; child care centers; automobile car wash in the IOP- 15, IOP-20 and IOP-25 districts; utility services; a continuing care retirement community (CCRC) under the provisions of a general development plan and certain requirements; and an active adult community in the IOP-35 zone.

2. Conditional uses include automobile service stations; permitted office, research, hospital, warehousing, manufacturing, fabrication and assembly operations shall be permitted limited accessory and incidental to retail outlets; warehousing; residence inns; outdoor equipment storage; commercial radio and other communications towers; a limited recycling operation in the IOP-20 district only; and assisted living residences.

The majority of the IOP zones are located in the center of the Borough, including lands at Fort Monmouth and Naval Weapons Station Earle. Several other smaller IOP zones are located in different sections of the Borough.

The Open Space Government Use designation represents a new land use category for Tinton Falls. This designation includes the County Park south of Route 33 and the County-owned parcels on the east side of Wayside Road. This category also includes those large publicly-held parcels including Fort Monmouth, Naval Weapons Station Earle, and the County Reclamation Center. The intent of this designation is to allow the existing activities on the properties as a matter of right while not committing to a specific zone assuming the properties become available for development.

It is recommended that the Borough give some thought to the ultimate disposition of these properties if they become available for development. For example, that portion of Earle located within Tinton Falls is an extremely valuable property from an open space perspective. It includes an extensive habitat suitable for rare and endangered species and would make an excellent open space tract. The landfill would ultimately close and could serve as an industrial park property or a portion might be used for intensive active outdoor recreation. The County should prepare a reuse Plan for the landfill's ultimate closure.

9.3 Monmouth County Plans

The Monmouth County Planning Board approach to planning is a reflection of the County Enabling legislation in New Jersey. Not having direct land use control, the County has assumed a leadership position by advocating for good planning at the municipal level, as well as preparing functional plans in cooperation with other County agencies. The following is a synopsis of the several plans the County has prepared.

Monmouth County Growth Management Guide

The Growth Management Guide was adopted by the Planning Board in December 1995. With a structure similar to the SDRP, outlining a series of goals, objectives, and policies in ten categories, the plan addresses air resources, centers, comprehensive planning, economic development, farmland preservation and agriculture development, historic, cultural, natural and scenic resources, housing, solid waste, transportation, and water resources.

Each of the categories has a goal with several objectives and related policies. The municipalities in Monmouth County use this document to address the statutory requirement of reviewing adjacent municipal plans, County plans, and the SDRP.

Monmouth County Open Space Plan

The Monmouth County Open Space Plan, adopted by the Monmouth County Planning Board, as an element of the Monmouth County Growth Management Guide in August 2006, specifically mentions the acquisition of a portion of the Fort Monmouth property as a new County park site. To fulfill this acquisition,

Monmouth County filed a Notice of Interest for park and recreation lands within Fort Monmouth property. The County subsequently filed an application to the National Park Service's Federal Lands to Park Program for a Public Benefit Conveyance, which was endorsed by the three host communities of Eatontown, Oceanport and Tinton Falls, and is consistent with their local land use policies and the current Fort Monmouth Reuse and Redevelopment Plan. This application was approved by the National Park Service on July 26, 2008. Conveyance of the requested property will be pursued as disposition and conveyance strategies are developed in conjunction with approval of the Reuse Plan.

Coastal Monmouth Plan

The Coastal Monmouth Plan (CMP) is a two-year regional planning effort that would create a vision for the future of the Monmouth County, NJ Atlantic Coastal Region, which spans over 27 miles of the New Jersey shoreline. Covering the region as a whole as well as each of the 30 municipalities within the study area (including Oceanport and Eatontown), the Plan's purpose is to help the communities prepare, collectively and individually, for sustainable growth, while protecting environmental resources and maintaining their unique coastal character.

The project started in the fall of 2006 and would be completed in the fall of 2008, with the Boroughs of Eatontown and Oceanport as two of the participants.

The Plan has several purposes:

a. To establish a set of planning alternatives to help coastal municipalities manage their remaining development potential, conserve open space, explore redevelopment opportunities and address the impacts of future growth on infrastructure, the natural environment, and the overall quality of life.

b. To formulate a plan that would be adopted as an element for the Monmouth

County Growth Management Guide.

c. To formulate a regional plan suitable for endorsement by the New Jersey State Planning Commission. (Project is receiving funding from the Department of Community Affairs).

The Plan would examine the region's land development pattern and identify the present and future capacity for growth to support economic development. Using demographic, socioeconomic and land use data, it would evaluate a set of planning alternatives to help the area guide future growth and conservation efforts. An Implementation Agenda would provide a strategic framework for municipalities, the County, and State agencies to follow in order to carry out identified strategies necessary to meet the vision of the Coastal Monmouth Region.

On March 15, 2007 the second meeting of the Coastal Regional Collaborative convened at Brookdale Community College, in the Student Life Center. Approximately 55 municipal representatives, stakeholders, and government agency officials from Monmouth County communities met. One of the announcements was that Freeholder Burry had asked the Monmouth County Planning Board to coordinate planning activities (of the study) with the Fort Monmouth Redevelopment Commission.

On May 30, 2007 a one-on-one meeting was conducted by the County with representatives from Neptune Township, Eatontown, and Ocean Township. The meeting took place at the Neptune City Borough Community Center. On June 13, 2007 a meeting was held with municipal representatives from Oceanport.

Monmouth County staff view redevelopment of the Fort as a regional issue, due to implications for vehicle traffic. The only definitive discussion items with the municipalities have been the need to maintain the Emergency Management Facility and the need to provide as much open space as possible. The County's involvement in the planning process would continue and evolve as the next steps occur.

9.4 New Jersey State Development and Redevelopment Plan

The New Jersey State Development and Redevelopment Plan (SDRP) is an outgrowth of the State Planning Act which was signed into law January 2, 1985. The SDRP was first adopted on June 12, 1992. It was revised and readopted on March 1, 2001 and presently is in the process of being reconsidered for readoption.

The purpose of the SDRP is to provide a vision for the future that would preserve and enhance the quality of life for all residents of New Jersey. The SDRP is the result of a cross-acceptance process that includes officials from counties, municipalities and the citizens of New Jersey in numerous public assemblies, discussing all of the major aspects of the Plan - its goals, strategies, policies, and application. This process ensures that the Plan belongs to the citizens of New Jersey, whose hopes and visions have shaped it.

Within the State Planning Act, the Legislature declared that the purpose of the SDRP is to:

Coordinate planning activities and establish Statewide planning objectives in the following areas: land use, housing, economic development, transportation, natural resource conservation, agriculture and farmland retention, recreation, urban and suburban redevelopment, historic preservation, public facilities and services, and intergovernmental coordination (N.J.S.A. 52:18A-200(f)

The objectives of the SDRP are outlined in its statewide goals and strategies, as follows:

1. Revitalize the State's Cities and Towns

- Protect, preserve, and develop the valuable human and economic assets in cities, towns, and other urban areas. Plan to improve their livability and sustainability by investing public resources in accordance with current plans which are consistent with the provisions of the State Plan. Leverage private investments in jobs and housing; provide comprehensive public services at lower costs and higher quality; and improve the natural and built environment. Incorporate ecological design through mechanisms such as solar access for heating and power generation. Level the playing field in such areas as financing services, infrastructure, and regulation. Reduce the barriers which limit mobility and access of city residents, particularly the poor and minorities, to jobs, housing, services, and open space within the region. Build on the assets of cities and towns such as their labor force, available land and buildings, strategic location, and diverse populations.

2. Conserve the State's Natural Resources and Systems

- Conserve the state's natural resources and systems as capital assets of the public by promoting ecologically sound development and redevelopment in the Metropolitan and Suburban Planning Areas, accommodating environmentally designed development and redevelopment in Centers in the Fringe, Rural and Environmentally Sensitive Planning Areas, and by restoring the integrity of natural systems in areas where they have been degraded or damaged. Plan, design, invest in and manage the development and redevelopment of Centers and the use of land, water, soil, plant, and animal resources to maintain biodiversity and the viability of ecological systems. Maximize the ability of natural systems to control runoff and flooding, and to improve air and water quality and supply.

3. Promote Beneficial Economic Growth Development and Renewal for All Residents of New Jersey

- Promote socially and ecologically beneficial economic growth, development and renewal, and improve both the quality of life and the standard of living of New Jersey residents, particularly the poor and minorities, through partnerships and collaborative planning with the private sector. Capitalize on the state's strengths—its entrepreneurship, skilled labor, cultural diversity, diversified economy and environment, strategic location and logistical excellence—and make the state more competitive through infrastructure and public services cost savings and regulatory streamlining resulting from comprehensive and coordinated planning. Retain and expand businesses, and encourage new, environmentally sustainable businesses in Centers and areas with existing infrastructure. Encourage economic growth in locations and ways that are both fiscally and environmentally sound. Promote the food and agricultural industry throughout New Jersey through coordinated planning, regulations, investments and incentive programs—both in Centers to retain and encourage new businesses and in the Environs to preserve large contiguous areas of farmland.

4. Protect the Environment, Prevent and Clean-Up Pollution

- Develop standards of performance and create incentives to prevent and reduce pollution and toxic emissions at the source, in order to conserve resources and protect public health. Promote the development of businesses that provide goods and services that eliminate pollution and toxic emissions or reduce resource depletion. Actively pursue public/private partnerships, the latest technology, and strict enforcement to prevent toxic emissions and clean up polluted air, land, and water without shifting pollutants from one medium to another; from one geographic location to another; or from one generation to another. Promote ecologically designed development and redevelopment in the Metropolitan and Suburban Planning Areas and accommodate ecologically designed development in Centers in the Fringe, Rural, and Environmentally Sensitive Planning Areas, to reduce automobile usage; land, water and energy consumption; and to minimize impacts on public health and biological systems, water and air quality. Plant and maintain trees and native vegetation. Reduce waste and reuse and recycle.

5. Provide Adequate Public Services at a Reasonable Cost

- Provide infrastructure and related services more efficiently by supporting investments based on comprehensive planning and by providing financial incentives for jurisdictions that cooperate in supplying public infrastructure and shared services. Encourage the use of infrastructure needs assessments and life-cycle costing. Reduce demands for infrastructure investment by using public and private markets to manage peak demands, applying alternative management and financing approaches, using resource conserving technologies and information systems to provide and manage public facilities and services, and purchasing land and easements to prevent development, protect flood plains and sustain agriculture where appropriate.

6. Provide Housing at a Reasonable Cost

- Provide adequate housing at a reasonable cost through public/private partnerships that create and maintain a broad choice of attractive, affordable, ecologically designed housing, particularly for those most in need. Create and maintain housing in the Metropolitan and Suburban Planning Areas and in Centers in the Fringe, Rural, and Environmentally Sensitive Planning Areas, at densities which support transit and reduce commuting time and costs, and at locations easily accessible,

preferably on foot, to employment, retail, services, and cultural, civic, and recreational opportunities. Support regional and community-based housing initiatives and remove unnecessary regulatory and financial barriers to the delivery of housing at appropriate locations.

7. Preserve and Enhance Areas with Historic, Cultural, Scenic, Open Space, and Recreational Values

- Enhance, preserve and use historic, cultural, scenic, open space, and recreational assets by collaborative planning, design, investment, and management techniques. Locate and design development and redevelopment and supporting infrastructure to improve access to and protect these sites. Support the important role of the arts in contributing to community life and civic beauty.

8. Ensure Sound and Integrated Planning and Implementation Statewide

- Use the State Plan and the Plan Endorsement process as a guide to achieve comprehensive, coordinated, long-term planning based on capacity analysis and citizen participation; and to integrate planning with investment, program, and regulatory land-use decisions at all levels of government and the private sector, in an efficient, effective, and equitable manner. Ensure that all development, redevelopment, revitalization, or conservation efforts support State Planning Goals and are consistent with the Statewide Policies and State Plan Policy Map of the State Plan.

These objectives are to be achieved through a series of statewide policies addressing equity, comprehensive planning, public investment priorities, infrastructure investments, economic development, urban revitalization, transportation, historic, cultural and scenic resources, air resources, water resources, open lands and natural systems, energy resources, waste, recycling and brownfields, agriculture, coastal resources, planning established by state statue (Meadowlands, Pinelands and Highlands), special resource areas, and design.

These statewide objectives are applied through the State Plan Policy Map which is divided into six (6) planning areas and five (5) levels of Centers. The planning areas, which do not coincide with municipal boundaries, attempt to address growth in terms of its character, location, and magnitude. The planning areas are:

1. ***Metropolitan Planning Area*** - The communities within the Metropolitan Planning Area have many things in common: mature settlement patterns resulting in a diminished supply of vacant land; infrastructure systems that generally are beyond or approaching their reasonable life expectancy; the need to rehabilitate housing to meet ever changing market standards; the recognition that redevelopment is, or would be in the not-too-distant future, the predominant form of growth; and a growing realization of the need to regionalize an increasing number of services and systems in light of growing fiscal constraints.

2. ***Suburban Planning Area*** - The Suburban Planning Area is generally located adjacent to the more densely developed Metropolitan Planning Area, but can be distinguished from it by a lack of high intensity urban form, by the availability of developable land, and by a more dispersed and fragmented pattern of predominantly low-density development. These areas are or would be served by regional infrastructure, except that, outside of Centers and major transportation corridors, there is limited, if any, availability of alternative modes of transportation to the automobile. These areas have generally been designated for growth in municipal Master Plans. As development expands, these services would become increasingly available if planned properly.

3. ***Fringe Planning Area*** - The Fringe Planning Area is a predominantly rural landscape (not prime agricultural or environmentally sensitive land) with scattered small communities and free-standing residential, commercial, and industrial development. Large investments in water and sewer and local road networks have not occurred and circulation is primarily provided by state and county highways supplemented by locally-maintained roads. Investments in water and sewer are mainly in existing or proposed Centers.

4. ***Rural Planning Area*** - The open lands of the Rural Planning Area include most of New Jersey's prime farmland, which has the greatest potential of sustaining continued agricultural activities in the future. They also include wooded tracts, lands with one or more environmentally sensitive features, and rural towns and villages.

4B. ***Rural/Environmentally Sensitive Planning Area*** - Some lands in the Rural Planning Area (PA4) have one or more environmentally sensitive features qualifying for delineation as Rural/ Environmentally Sensitive (PA4B). This sub-area contains valuable ecosystems or wildlife habitats. Rural/Environmentally Sensitive Planning Areas are supportive of agriculture and other related economic development efforts that ensure diversity within New Jersey. Any development or redevelopment planned in the Rural/Environmentally Sensitive Area should respect the natural resources and environmentally sensitive features of the area.

5. ***Environmentally Sensitive Planning Area*** - The Environmentally Sensitive Planning Area contains large contiguous land areas with valuable ecosystems, geological features and wildlife habitats. The Environmentally Sensitive Planning Area is highly vulnerable to damage of many sorts from new development in the Environs, including fragmentation of landscapes, degradation of aquifers and potable water, habitat destruction, extinction of plant and animal species and destruction of other irreplaceable resources which are vital for the preservation of the ecological integrity of New Jersey's natural resources.

Centers are the SDRP's preferred vehicle for accommodating growth. Center-based development patterns are superior to sprawl for a number of reasons (see sidebar on page 231). A Center's compact form is considerably more efficient than sprawl, providing opportunities for cost savings across a wide range of factors. Compact form also translates into significant land savings. A Center's development form and structure, designed to accommodate diversity, is also more flexible than single-use, single-purpose sprawl, allowing Centers to evolve and adapt over time, in response to changing conditions and markets. Centers promote community, protect the environment, provide enhanced cultural and aesthetic experiences, and offer residents a superior quality of life. The five types of centers are:

Urban Center- Generally the largest Centers, offering the most diverse mix of industry, commerce, services, residences and cultural facilities (Newark, Jersey City, Atlantic City, Camden)

Regional Centers - A compact mix of residential, commercial and public uses, serving a large surrounding area and developed at an intensity that makes public transportation feasible. (Red Bank, Eatontown, Long Branch).

Towns - Traditional Centers of commerce or government throughout New Jersey, with diverse residential neighborhoods served by a mixed-use Core offering locally oriented goods and services (Freehold, Highland Park, Matawan, Atlantic Highlands)

Villages - Primarily residential places that offer a small Core with limited public facilities, consumer services and community activities (Englishtown, Pine Brook, Hance Park)

Hamlets- Small-scale, compact residential settlements organized around a community focal point, such as a house of worship, luncheonette, small park or a civic building (Adelphia, Imlaystown)

The SDRP is shaped through a Cross-Acceptance process that involves all stakeholders. In the State Planning Act Cross-Acceptance is the prescribed method for advancing the goals and vision of the SDRP. According to the Act it is:

"a process of comparison of planning policies among governmental levels with the purpose of attaining compatibility between local, county and State plans. The process is designed to result in a written statement of agreement or disagreement and areas requiring modification by parties to the cross acceptance." (N.J.S.A. 52:18A-202.b.)

This description has been embodied in rules which in turn have led to a process of comparison and identification of issues and recommendations by the counties such as Monmouth on behalf of its municipalities. It then proceeds to series of negotiations where agreements, disagreements, and issues which require further discussion are identified or are resolved in the process of Plan Endorsement. The agreed upon issues result in revisions or modifications to the SDRP and the points of disagreement and further issues in need of refinement move forward into the final phase of Cross-Acceptance, the issue resolution phase.

Implementation of SDRP is carried out by State agencies, regional entities, Counties, and municipalities. State agencies do it by not only participating in the Cross-Acceptance process but also by incorporating the SDRP's policies and provisions into their functional plans such as transportation, water supply, and wastewater management. Along with regional agencies, State agencies use the policies of the SDRP in their public investments and in their regulatory programs, such the Coastal Area Facilities Review Act (CAFRA) which utilizes the State Plan Policy Map to regulate impervious surface.

On April 28, 2004 the State Planning Commission approved the release of the Preliminary State Development and Redevelopment Plan (State Plan) and the Preliminary State Plan Policy Map. This action launched the third round of Cross-Acceptance. At the same time a revised State Plan Policy Map was also released. Both documents did not impact Fort Monmouth.

As 2008 progresses, the Cross-Acceptance process is in the final phase. Monmouth County's negotiation with the State Planning Commission concluded with a public hearing on August 21, 2007. Nine agreements between the State Planning Commission and the County were reached which involved Tinton Falls, but none of them impacted Fort Monmouth. The State Planning Commission is now in the process of preparing a Final Draft Plan.

Municipalities and counties can implement the policies and provisions of the SDRP informally or formally. The formal process is called Plan Endorsement. It ensures that municipal, County, regional, and State Agency plans are consistent with the State Development and Redevelopment Plan and with each other. An endorsed plan entitles municipalities and counties to a higher priority for available funding, streamlined permit reviews, and coordinated state agency services. Priority is given to county and regional strategic plans.

In Monmouth County several regional initiatives have been advanced by the County Planning Board. The most advanced is the Western Monmouth Development Plan which involves Howell, Freehold, Marlboro and Manalapan Townships, Freehold, Englishtown and Farmingdale. Other Monmouth County efforts have resulted in pre-petition meetings for the Coastal Region Plan involving Allenhurst, Little Silver, Rumson, Asbury Park, Loch Arbour, Sea Bright, Avon, Long Branch, Sea Girt, Belmar, Manasquan, Shrewsbury Borough, Bradley Beach Monmouth Beach, Shrewsbury Township, Brielle, Neptune City, South Belmar, Deal, Neptune Township, Spring Lake, Eatontown, Ocean Township, Spring Lake Heights, Fair Haven, Oceanport, Wall, Interlaken, Red Bank, and West Long Branch.

A pre-petition meeting was also held for the Bayshore Plan involving Atlantic Highlands, Aberdeen Township, Hazlet, Holmdel Township, Keansburg, Highlands, Keyport, Matawan, Middletown, and Union Beach.

It is anticipated that upon completion of the Coastal Monmouth Plan it would be filed with the State Planning Commission for Plan Endorsement.

It is recommended that each of the Fort Monmouth municipalities petition the State Planning Commission for Plan Endorsement, particlarly since the FMERPA Plan recommends a new center in each of the three municipalities. Eatontown held a pre-petition meeting for Plan Endorsement with the Office of Smart Growth and other State agencies on November 20, 2007. Oceanport, which falls within the CAFRA zone, would be required to work with the Office of Smart Growth and NJDEP to designate the Town Center within the Borough.

9.5 Fair Housing Considerations

Existing Housing on Fort Monmouth

According to the official report from the Garrison, the existing complement of housing on Fort Monmouth is less than 1,000 dwelling units. Table 9-1 shows additional detail.

Council on Affordable Housing

Affordable housing is an important part of a balanced land use plan. Yet defining the dimensions of affordable housing need is difficult. The range of below market rate housing options serves a clientele that spans from the homeless to households spending an inordinate amount of income on housing (cost burden), but it also includes the workforce housing needed to assure that New Jersey can remain competitive in attracting and retaining industry.

New Jersey is a national leader in defining the affordable housing obligations of its municipalities. Home to the Mount Laurel doctrine, a pronouncement of New Jersey's Supreme Court that identified the constitutional obligation, municipalities are held accountable to assure that the zoning governing lands within their borders provides a realistic opportunity for the creation of the municipality's fair share of the affordable housing need in the region.

New Jersey has codified the Mount Laurel decisions through the Fair Housing Act and Administrative Code regulations of the Council on Affordable Housing (COAH). Charged with calculating and disaggregating affordable housing needs in the state, COAH has on several occasions promulgated substantive and procedural rules governing the production of affordable housing. In their initial iteration, the COAH rules calculated regional housing need for rehabilitation of substandard units occupied by lower income households and for the construction of new units to meet regional needs. "Fair share" assignments were made on a municipality by municipality basis requiring a minimum, that local zoning provide a realistic opportunity to accommodate these units. In subsequent iterations of the rules, referred to as the Second Round and Third Round rules, the calculated need assessments

were reexamined and adjusted. In the Third Round rules a new concept was included which is referred to as "growth share". The Third Round rules continue assignment of rehabilitation need, prior round recalculated need, and the new growth share element. The Third Round rules were effective December 20,2004 and amended on May 15, 2006. These rules projected that the Statewide need for housing affordable to low- and moderate-income households approximated roughly 53,000 dwelling units.

New Jersey's Appellate Division concluded in January 2007 that the initial Third Round rules were flawed and directed COAH to remedy certain defects and promulgate revised rules. Among the criticisms by the Appellate Division was its finding that the rules would not realistically accomplish the identified need and in fact understated the extent of such need.

In the initial Third Round rules, growth share required the production of an affordable unit for every eight new market rate dwelling units. Affordable housing obligations also accrued from job creation, and the original Third Round rules required one affordable unit for every 25 jobs, with the calculation of jobs based on floor area by building use group, a typology used by the New Jersey Department of Community Affairs in its administration of the Uniform Construction Code.

After revisiting the need calculations, COAH proposed a target of 115,666 affordable units statewide by the year 2018 and modified several of the terms of the growth share provision. Most notably, the affordable housing production requirements doubled from one affordable unit per eight market-rate dwelling units (one affordable among 9 total units) to one affordable unit per four market-rate dwelling units (one affordable among 9 total units). A fifth market unit is provided as the presumptive compensatory benefit in return for construction of one

Table 9-1: Existing Housing

Neighborhood	# Units	Total Occupied	% Occupied	Total Vacant	Vacant Ready	Vacant Not Ready
Russel/Allen	32	27	84.38%	5	4	1
Russel/Carty	36	31	86.11%	5	5	0
Megill	42	37	88.10%	5	1	4

TOTALS:	663	160	24.13%	503	12	491
Lodging Buildings:						
361, 362, 363, 364, 270*, 271, 1077, 1078	251					
Total w/lodging	914					
Dorm Rooms* @ Prep School	71					
Total w/lodging and Dormitory Rooms	985					
**Dormitory Rooms and Building 270 units do not have individual kitchens or kitchenettes.*						
216 Includes both sides of double units (19 double units)						
1, 3, 5, 7 Gosselin Avenue-Quarters not renovated						

affordable housing unit. Application of the growth share concept has also been modified in NJAC 5:97 et seq., with jobs gained from non-residential space accruing an obligation for one affordable unit for every 16 jobs.

Additionally, where demolished dwelling units were previously subtracted from the growth share obligation under the initial Third Round rules, such residential reconstruction would be considered a new unit with a growth share obligation, despite the fact that the net number of dwelling units has not increased with the removal and replacement of an existing dwelling.

On May 6, 2008, COAH adopted N.J.A.C. 5:97, which became effective on June 2, 2008. In consideration of the extensive public comments, COAH also proposed amendments to N.J.A.C. 5:97, which were published on June 16, 2008 with a public comment period extending to August 15, 2008. The proposed rule also recalculated the housing need by municipality, producing the third set of affordable housing assignments that municipalities have had to address in the Third Round.

Prospects for redevelopment at Fort

Monmouth received a boost on July 17, 2008, when Governor Corzine signed the latest amendment to the Fair Housing Act (A-500/S-1783) making FMERPA one of the regional planning entities whose jurisdiction is called out for special COAH treatment. As a result of this legislation, COAH is convening a working group including mayors of the host towns to address key issues related to the method of calculating affordable housing obligations. This will be particularly important to FMERPA's ability to adopt and implement a viable reuse plan for robust redevelopment.

Recognizing that COAH's presumptive affordable housing set-aside (at least 20 percent of the residential units) could interfere with the economic feasibility of the redevelopment of Fort Monmouth, the Act now provides potential adjustments of the COAH obligation, which can mitigate the dire circumstances surrounding the Fort closing. This could be essential to an economically viable plan, especially since municipal compliance options are changing at a time when municipal affordable housing obligations have increased dramatically. The elimination of the Regional Contribution Agreement (RCA), a key COAH compliance mechanism

that allowed municipalities to fund affordable housing construction outside their jurisdiction, puts new pressure on the State's remaining vacant lands and municipal resources.

A statewide commercial development fee (2.5% of value), which became effective upon signing by the Governor, now provides the uniform mechanism whereby commercial developers can discharge the affordable housing obligation they create for the municipality. As Fort Monmouth's closing impacts the host municipalities and the regional economy, prospects for timely and efficient redevelopment will depend on the economics of the plan, and a unique approach to the COAH mandate, as envisioned in the Fair Housing Act, will be essential.

As FMERPA examines the affordable housing responsibilities affecting the Fort Monmouth lands, several facts must be recognized:

1. Currently, due to its existence as a federally-owned property, Fort Monmouth accrues no affordable housing obligation according to the Fair Housing Act and the COAH rules. Any responsibility for accomodating future affordable housing needs resides with the municipality to which the housing obligation would be assigned or within which growth occurs. However, the Reuse Plan accomodates the future possibility of affordable housing units in each of the three host municipalities on the Fort Monmouth property.
2. The US Department of Housing and Urban Development has prioritized the reuse of military installations closed through the Base Realignment and Closing Commission procedure for housing of the homeless. This is a burden not imposed by the State of New Jersey and not quantified by any government agency. The Corporation for Supportive Housing conducted a HUD mandated Point In Time Survey on January 29, 2008 under contract to the New Jersey Housing and Mortgage Finance Agency (HMFA). This survey identified 452 homeless persons in Monmouth County, representing 6% of the Statewide total.
3. The proposed redevelopment at Fort Monmouth would be substantially impacted by the cost implications of the proposed COAH rules, although the uncertain nature of the final rule provisions makes this impact difficult to accurately predict.

In summary, the impact of COAH's affordable housing requirements to the host municipalities, as they relate to Fort Monmouth's redevelopment, is not possible to predict accurately at this time. However, with the recent adoption of N.J.A.C. 5:97, and with amendments currently proposed, the effective rules and the proposed amendments result in the following COAH-assigned municipal affordable housing obligations.

Eatontown

- Under the original Third Round rules Eatontown's total fair share obligation was comprised of a municipality's rehabilitation share, the total remaining obligation from prior rounds, and the growth share. As indicated in Appendix C of N.J.A.C. 5:94, Eatontown's rehabilitation share was 12 units, and Eatontown's total remaining obligation from prior rounds was 503 units. Eatontown's growth share obligation was 69 units.

- Under the newly effective N.J.A.C. 5:97, Eatontown's rehabilitation share is 32 units, and Eatontown's total remaining obligation from prior rounds is 504 units. Eatontown's growth share obligation is 429 units.

- Under the proposed amendments to N.J.A.C. 5:97 the only change is in the growth share, which is proposed to increase to 491 units.

Table 9-2: Housing Rules

Municipal Fair Share	Rehabilitation	Prior Round Obligation	Growth Share
Eatontown			
Original Round 3 (N.J.A.C. 5:94)	12	503	69
Effective rules N.J.A.C. 5:97	32	504	429
Proposed amendments	32	504	491
Oceanport			
Original Round 3 (N.J.A.C. 5:94)	0	157	26
Effective rules N.J.A.C. 5:97	0	149	43
Proposed amendments	0	149	53
Tinton Falls			
Original Round 3 (N.J.A.C. 5:94)	0	655	178
Effective rules N.J.A.C. 5:97	26	622	555
Proposed amendments	26	622	494

Source: Banisch Associates, Inc.

Oceanport

- As indicated in Appendix C of N.J.A.C. 5:94, Oceanport's original Third Round rehabilitation share was 0, the total remaining obligation from prior rounds was 157 units and the growth share obligation was 26 units.

- Under N.J.A.C. 5:97 as recently adopted, Oceanport's rehabilitation share is 0 units, Oceanport's total remaining obligation from prior rounds is 149 units and the growth share obligation is 43 units.

- Under the proposed amendments Oceanport's growth share obligation would increase to 53 units.

Tinton Falls

- As indicated in Appendix C of N.J.A.C. 5:94, Tinton Falls' initial Third Round rehabilitation share was 0, the total remaining obligation from prior rounds was 655 units, and the Tinton Falls' growth share obligation was 178 units.

- Under N.J.A.C. 5:97, Tinton Falls' rehabilitation share is 26 units, the total remaining obligation from prior rounds is 622 units, and Tinton Falls' growth share obligation is 555 units.

- Under the proposed amendments, Tinton Falls' growth share would decrease to 494 units

Housing for the Homeless

According to the Base Closure Community Redevelopment and Homeless Assistance Act of 1994 (Pub. L. 103-421) ("Homeless Assistance Act"), State and local governments, representatives of the homeless, and other interested parties may submit to the local redevelopment authority a notice of the interest in the buildings or property, or any portion thereof. The local redevelopment authority can negotiate with qualified homeless providers to accommodate some of the needs of the homeless on the base. The redevelopment authority shall, in preparing the reuse and redevelopment plan, consider these interests to assist the homeless in the use of the buildings and property at the installation that are expressed in the notices of interest submitted to the redevelopment authority.

While there are no numerical requirements stipulated in the Homeless Assistance Act, the property at Fort Monmouth would accommodate a variety of opportunities to serve the homeless, which would be required in order to receive HUD approval of FMERPA's reuse plan.

The accommodations that are supported by FMERPA and being submitted to HUD are:

1. Building 501, currently the Counseling Center, is recommended to be conveyed to Family Promise, a faith-based non-profit organization, for use as a day center for up to 10 homeless families. As no families would be in residence at this location, there would be no additional burden on the local school district.

2. A single adult shelter to house up to 40 homeless single adults. This shelter is currently located on Fort Monmouth in Buildings 417 and 421. As these buildings are currently in the FEMA designated flood plain and the shelter is not appropriately located in their current location for the development planned for that area of the Fort Monmouth, a new shelter is proposed to be built to the east of Squier Hall. Should it become necessary to vacate the current facilities before the new shelter is built, facilities would need to be made available in the interim. As no children would be in residence at this shelter, there would be no additional burden on the local school district.

3. Building 270, a lodging facility is recommended to be conveyed to the Affordable Housing Alliance as part of a Permanent Supportive Housing Bank. This building is proposed to house an assisted living, Single Room Occupancy (SRO) program. This facility would consist of a minimum of 16 bedroom units. As no families would be in residence at this location, there would be no additional burden on the local school district.

4. A total of 40 single family units for permanent supportive housing are recommended to be conveyed to the Affordable Housing Alliance as part of a Permanent Supportive Housing Bank. These units would be located at scattered sites within the housing units planned for the Eatontown and Tinton Falls reuse areas. It is proposed that these units consist of two - 4 bedroom units, eight – 3 bedroom units, twenty – 2 bedroom units and ten – 1 bedroom units.

5. Additionally, 180 Turning Lives Around, Inc. would be acquiring and constructing an expanded, replacement, safe house for victims of domestic violence and their children at an off-site property located within the Fort Monmouth Region. FMERPA is recommending that a monetary accommodation in the amount of $4.5 million be given to 180 Turning Lives Around, Inc. to help fund the acquisition and construction of this new safe house at an off-site location.

Although not a homeless accommodation, FMERPA would also be recommending conveyance of land to accommodate a Public Benefit Conveyance Notice of Interest request, for Self-Help Housing.

10.0 NEXT STEPS: IMPLEMENTING THE VISION

10.0 Next Steps: Implementing the Vision

The vision for the reuse and redevelopment of Fort Monmouth calls for the creation of a Sustainable Technology Community composed of activity zones designed to energize the site and blend with the fabric of the host communities, while also respecting existing neighborhood character. This Plan has been developed in cooperation with the host municipalities and Monmouth County, who have identified local objectives, and is documented in the preceding chapters of this Plan through diagrams, plans, illustrations, text, and tabular data.

This chapter identifies the necessary steps for realizing the Fort's transformation into a built Sustainable Technology Community. The planning process for reaching the desired results for the Reuse Areas does not end with the completion of this Plan. Additional review and analysis would need to occur prior to the formal adoption of a preferred Final Reuse Plan. The following steps are necessary to finalize the Plan and begin the process of implementation.

10.1 Implementation

1. RESOLVE COAH OBLIGATIONS

The revised Third Round COAH rules, outlining municipal affordable housing obligations, were up for adoption in June 2008. FMERPA commented on the proposed rule, asking whether the affordable housing obligation related to Fort Monmouth could be met by the host municipalities on a regional rather than individual basis. FMERPA and the Boroughs are involved in ongoing discussions to clarify the COAH obligation for the redevelopment of Fort Monmouth and the three municipalities.

2. FINALIZE COMMUNITY IMPACT ANALYSIS

The multi-disciplinary planning team and FMERPA have held extensive discussions with the communities regarding the assessment. Fully analyzing, developing, understanding, and building consensus on the potential impacts of the area's reuse and redevelopment are critical to the Plan's adoption by FMERPA with support of the local municipalities. Coordination between FMERPA, the planning team, and the community will continue beyond the release of this Final Plan.

3. EXPLORE POTENTIAL BENEFITS OF A REVENUE SHARING MODEL OR INTER-LOCAL AGREEMENTS

A model for Revenue and Cost Sharing that provides a win-win-win scenario for the three Boroughs can only be developed with a full understanding of the community impacts of redevelopment and reuse. During this ongoing phase of work, a range of sharing structures should be explored. These could include formation of an oversight entity, or the establishment of a series of inter-local agreements between the Boroughs to provide the required services in an efficient manner.

4. CONCEPT PLAN ADOPTED

This Reuse Plan is intended to serve as a guiding document to FMERPA and other regulatory authorities as the Reuse Plan is evaluated. FMERPA adopted the Reuse Concept Plan on September 03, 2008, understanding that the Final Reuse Plan would continue to evolve. The adoption of the Reuse Concept Plan sends an important message to community members and state and local officials that FMERPA supports the Reuse Plan and planning essentials set forth in the Plan.

5. PROMOTE THE REUSE PLAN

FMERPA should continue to review the Plan with the host municipalities and other public and private stakeholders. This would enable FMERPA to maintain a level of public involvement and continually receive, and incorporate into the planning process, valuable public input, a crucial process for building consensus and setting the stage for successful implementation. To communicate the vision for the Reuse Areas, a variety of media should be engaged including brochures, websites, and print and televised media. These vehicles would allow FMERPA to promote the Plan, and make it a tool for transformation of Fort Monmouth that "learns" how to evolve in response to changing economic and other circumstances. To aid this process, the State, municipalities, and FMERPA should develop a communications strategy and allocate funds to ensure the sustained promotion of the Plan.

6. COLLABORATE

The strength and viability of the Plan would rely on multi-level partnerships. These should include partnerships between the State of New Jersey, Monmouth County, and the host and adjacent Boroughs, the Department of the Army, the Department of Housing and Urban Development (HUD), local advocates, and the redevelopment community.

The Reuse Plan is just one component of the larger BRAC process. Additional review of the Plan is necessary and the Final Reuse Plan should incorporate the requirements of NJDEP regarding cleanup, the implications of newly-adopted COAH requirements, compliance with the NJ SHPO requirements, and the HUD Homeless Screening Process.

7. ADOPT ZONING AND A FORM-BASED CODE

The Fort Monmouth Implementation Local Redevelopment Authority (LRA) should adopt a Form-Based Code to guide the redevelopment process. The Code should be referred to the three Boroughs as required by N.J.S.A. 52-27I-14.

A Form-Based Code would allow as-of-right development of the property in conformance with standards designed to achieve the stated vision of the Reuse Area, and eliminate the guessing game often associated with conventional zoning. Recognizing that the Reuse Area would continue to contain valuable historic resources, the Form-Based Code would include mechanisms for the proper maintenance of historic structures and a strict review process for new development. Appropriate regulations that are supportive of community-endorsed policies can encourage reuse and redevelopment by providing transparency, clarity, and certainty. By establishing clear standards that support the Boroughs' vision, a Form-Based Code would provide a visual guide to design character, helping FMERPA and the communities assure that reuse and redevelopment would occur in a desirable fashion

8. ESTABLISH THE OFFICE OF THE POST ARCHITECT

FMERPA's Implementation LRA should establish the Office of the Post's Architect and establish the position of Post Architect. This professional should have a full understanding of the principles that underpin the Reuse Plan, as well as a comprehensive understanding of the historical significance and heritage of Fort Monmouth. The Post Architect should oversee the application of the Fort's zoning and form-based code. The Post Architect in concert with the LRA and local authorities would review development and building plans for compliance with regulating ordinances and provide design guidance as the Plan evolves over time.

9. EVALUATE STAFFING NEEDS OF THE IMPLEMENTATION LRA

At the conclusion of the Planning LRA's duties, an Implementation LRA should be formed to oversee the reuse and redevelopment of the Post. Consideration of the specialized staffing needs should be undertaken in the near future. A staffing Plan should be developed to address Post promotion and marketing, day to day operations, implementation of the reuse Plan, economic development policies and incentives, environmental protection, historic preservation, maintenance of facilities and infrastructure, legal counsel, ongoing public communications, and administrative support.

10. MAINTAIN INFRASTRUCTURE

Resources need to be made available to insure that infrastructure repairs are met by Federal Authorities while they still control the property. Some infrastructure demands would be met by market forces and user fees, while other services would require ongoing support of the LRA, Boroughs, or County such as police and fire protection, maintenance of streets, roads, bridges and parks. Returning infrastructure in working condition to the appropriate authority is critical to early success of the Plan. Additional investigation of how the utility infrastructure would be operated is warranted as it could provide revenue to the LRA in support of future reuse.

11. BEGIN ENVIRONMENTAL CLEAN-UP

Fort Monmouth clean-up before reversion is critical. The Implementation LRA should analyze the options for clean-up and remediation of contaminated areas of the Post. Discussion with the federal government to further understand clean-up funding availability and timetables should be undertaken. Alternative approaches to federal clean-up including privatization for the clean-up process warrant exploration.

12. PURSUE FUNDING MECHANISMS

To achieve the goals for reuse of Fort Monmouth, discussions should be entered into with Federal, State, County, and Borough representatives to further explore a variety of funding mechanisms. Key funding sources used at other base closings include:

- Bonds and private debt
- Federal, State, County and Local Government Appropriations
- Federal and State grants
- Local Redevelopment Authority revenues.

Additional funding sources for reuse and redevelopment include private foundation grants, private investment capital, tax credits, impact fees, business improvement districts, and special assessment districts. The format of real estate transactions would also have an impact on the degree to which funding would be needed from public sources. Short- and long-term leases and rental opportunities, as well as the sale of structures and property can assist with lessening the financial impact of the maintenance and upkeep of the property.

13. ATTAIN SHPO APPROVAL OF HISTORIC DISTRICT(S)

The LRA should hire a Historic Preservation Consultant to prepare the necessary studies and reports for SHPO in support of the creation of historic districts at the Post. These analyses should also prepare a plan for the long-term maintenance and protection of the Post's valuable heritage resources.

14. PRO-ACTIVELY MARKET FORT MONMOUTH

Additional plans and strategies would be required in the years ahead to properly market and position Fort Monmouth. The Implementation LRA should further detail and implement a marketing strategy to attract businesses, residents, institutions, and visitors to Fort Monmouth. This strategy should focus on the branding and identity of Fort Monmouth as a Sustainable Technology Community, where heritage tourism, protected open spaces and economic vitality are combined for a desirable quality of life and beneficial future as these areas formerly behind the fence become reintegrated into the fabric of the boroughs.

10.2 Impact Statement

The County of Monmouth and the communities contiguous to Fort Monmouth have long enjoyed a communal relationship with both the employees and the military personnel at the Fort. This social and economic interaction has been an essential fiber in the fabric of this Central New Jersey region. The strength of this fabric has been severely diminished as a result of the 2005 BRAC decision to close Fort Monmouth. The impact of this decision cuts across a myriad of social and economic issues, many of which are being addressed through the creation of the Fort Monmouth Reuse and Redevelopment Plan and the associated economic, social, and infrastructure studies that support the Plan. In order for this region to continue to prosper following the Fort closure as dictated by the BRAC decision, careful and measured execution of a robust economic revitalization strategy is mandatory. This should be carried out in concert with addressing the obvious needs for affordable housing and the homeless continuum. The uncertainty that these elements bring to the residents of the three host communities of Tinton Falls, Eatontown, and Oceanport, which are already reeling from the economic downturn and one of the most severe tax burdens in the country, is further aggravated by the enormity of the prospective infrastructure costs that their towns face.

While the Plan itself, as a land use concept, enjoys the support of a majority of the area's people, much of the skepticism of its execution is centered around the cost and the time to execute the Plan. Necessary improvements to essential components such as electrical service, potable water, sewerage treatment, sludge removal and treatment, local and regional traffic mitigation, and public transportation availability will require extensive funding, very little if any of which will be available from an already deficit ridden State. Without the necessary funding from private or federal sources to address these essential components, the Plan, regardless of its enormous upside potential, may fail. And failure is not an option.

Therefore, we look forward to addressing this Plan, its potential contributions to the revitalization of the region, and its attendant needs, with our colleagues at the Department of the Army.

EXECUTIVE SUMMARY

This *Remedial Action Progress Report* (RAPR) documents the quarterly ground water sampling of 10 monitoring wells at the M-5 Landfill (FTMM-05) from the 1st Quarter 2009 through the 3rd Quarter 2010 to monitor the progress of the enhanced natural attenuation program [Hydrogen Release Compound® (HRC®)] in reducing contaminant of concern (COC) concentrations in ground water. A proposed Ground Water Classification Exception Area (CEA) is also provided herein.

The M-5 Landfill consists of approximately 3.2 acres located on the western portion of the Main Post on the Eatontown/Oceanport Borough line. The site is bordered by Mill Creek and Parkers Creek to the west and is adjacent to the southern boundary of the M-8 Landfill.

A *Remedial Action Work Plan* (RAWP) was submitted by ATC Associates, Inc. (ATC) in February of 2000 and approved by the New Jersey Department of Environmental Protection (NJDEP) in March of 2001. The RAWP proposed enhanced natural attenuation with ground water monitoring as the site remedy for tetrachloroethene (PCE). PCE, trichloroethene (TCE), *cis*-1,2-dichloroethene (*cis*-1,2-DCE), and vinyl chloride have been identified as COCs in subsequent RAPRs submitted to the NJDEP.

Ground water monitoring conducted during the current reporting period identified PCE, TCE, and vinyl chloride at concentrations that exceeded the NJDEP's Ground Water Quality Standards (GWQS) for Class II-A aquifers. PCE was detected at concentrations greater than the NJDEP GWQS of 1 microgram per liter (µg/L) in five monitoring wells (M-5MW11, M-5MW16, M-5MW19, M-5MW20, and M-5MW23). TCE was detected at concentrations greater than the NJDEP GWQS of 1 µg/L in four monitoring wells (M-5MW16, M-5MW19, M-5MW20, and M-5MW23). *cis*-1,2-DCE was detected at concentrations exceeding the NJDEP GWQS of 70 µg/L in monitoring wells M5-MW16 and M5-MW20. Vinyl chloride was detected at concentrations greater than the NJDEP GWQS of 1 µg/L in monitoring well M-5MW16 only. In addition, two metals (arsenic and antimony) were detected at concentrations exceeding NJDEP GWQS. These metal detections are the direct result of acid leaching of suspended solids in ground water samples. Therefore, metals are not considered COCs at the M-5 Landfill. In addition, due to the extremely slow migration rates of metals in ground water, they pose little potential for migration.

During the current reporting period, surface water samples were collected from three locations along Mill Creek and Laferta Creek: SS-24 (upstream of M-5 Landfill), SS-5 (along the western boundary of M-5 Landfill), and SS-28 (downstream of M-5 Landfill). PCE concentrations exceeded NJDEP Surface Water Quality Standards (SWQS) in SS-5, SS-24, and SS-28. TCE concentrations exceeded NJDEP SWQS in SS-24. Although PCE and TCE were detected at concentrations exceeding NJDEP SWQS, the location and distribution of COCs suggests that the M-5 Landfill is not the probable source for these VOCs.

Future plans include collection of quarterly ground water and surface water samples until closure

of Fort Monmouth in September 2011. At that time, future sampling will be evaluated and discussed with NJDEP. The Army plans to prepare a Remedial Action Selection Report (RASR)/Feasibility Study (FS) as the next report submittal, which will include a final closure plan for the M-5 Landfill.

1.0 INTRODUCTION

An enhanced natural attenuation program to remediate VOC concentrations at the M-5 Landfill (FTMM-05) located at the Main Post Area of Fort Monmouth, New Jersey is being conducted in accordance with the RAWP prepared by ATC Associates, Inc. (ATC) in February of 2000 and approved by the NJDEP in March of 2001. This RAPR documents ground water and surface water monitoring conducted during the current reporting period of the 1st Quarter 2009 through the 3rd Quarter 2010.

1.1 Objectives

The objective of this RAPR is to document the implementation of the remedial action (RA) program performed at the M-5 Landfill during the current reporting period (1st Quarter 2009 through the 3rd Quarter 2010). HRC® injections were implemented by the Army from October of 2000 to December of 2005 as an RA based upon the recommendations in the RAWP prepared by ATC dated February 2000 and approved by the NJDEP in March of 2001. The purpose of the RA was to treat the COC-affected areas at the site using HRC® to reduce COC concentrations to comply with the NJDEP GWQS. The remedial activities were conducted in accordance with the NJDEP's *Technical Requirements for Site Remediation* (*Technical Requirements*), N.J.A.C. (New Jersey Administrative Code) 7:26E *et seq*. and the M-5 Landfill RAWP.

The RA and subsequent preparation of this RAPR encompassed the following:

- Conducting quarterly rounds of ground water and surface water sampling and documenting the results to evaluate the effectiveness of the RA;
- Comparing the results of ground water and surface water sampling with NJDEP GWQS and NJDEP SWQS;
- Identifying and discussing recommendations with the Army for the continuation of this RA; and
- Documenting remedial activities as required by the *Technical Requirements*.

1.2 Report Organization

Section 2.0 discusses site history and background information for the M-5 Landfill. Section 3.0 describes and summarizes the remedial activities conducted at the site. Section 4.0 discusses ground water and surface water monitoring and sampling activities at the site. Section 5.0 presents the laboratory analytical results of the ground water and surface water sampling. Sections 6.0 and 7.0 discuss the Background Metals Evaluation and Receptor Evaluation respectively. Section 8.0 discusses the effectiveness of the RA and provides recommendations to the Army for the M-5 Landfill. Section 9.0 is the Classification Exception Area (CEA) section and Section 10.0 provides a list of references used during generation of this report.

2.0 SITE BACKGROUND

The following sections describe the site background of the M-5 Landfill. Provided is a description of the site location, site history, background investigations, and previous technical reports.

2.1 Site Location and Description

Fort Monmouth is located in the central-eastern portion of New Jersey in Monmouth County, approximately 45 miles south of New York City and 70 miles northeast of Philadelphia. The M-5 Landfill is located on the western portion of the Main Post on the Eatontown/Oceanport Borough line and east of Mill Creek and Parkers Creek and consists of approximately 3.2 acres (Figure 2-1 – Site Location Map). The M-5 Landfill is adjacent to the southern boundary of the M-8 Landfill. According to a report prepared by the US Army Toxic and Hazardous Materials Agency (USATHAMA) entitled *Installation Assessment of Fort Monmouth, Report 171* dated May 1980, the M-5 Landfill was in use from 1952 to 1959 for the general disposal of domestic and industrial wastes in addition to automobiles. This site has reportedly been inactive since 1959. Since then there has been a steady growth and stabilization of vegetation (grass, trees, and bushes) on site. The environmental setting (regional/local geology and hydrogeology) of the M-5 Landfill is described in ATC's RAWP.

2.2 Site History and Background Investigations

The US Army Corps of Engineers (USACE), Baltimore District initially contracted Roy F. Weston, Inc. (Weston) to perform a site investigation (SI) at Fort Monmouth, New Jersey. Suspected hazardous waste sites were identified at Fort Monmouth in a report prepared by USATHAMA (1980). The USATHAMA report identified 37 sites with known or suspected waste materials on the Main Post and Charles Wood Area. Weston conducted a background investigation of the 37 sites plus eight additional sites that were identified by Fort Monmouth and the NJDEP. Weston's findings were described in a report entitled *Investigation of Suspected Hazardous Waste Sites at Fort Monmouth, New Jersey* (1993). The M-5 Landfill was one of the 37 sites identified.

In 1995, Weston conducted an SI of the M-5 Landfill and prepared an SI Report (December 1995). The Weston SI Report entitled *Final Site Investigation, Fort Monmouth, New Jersey, Main Post and Charles Wood Areas* (Appendix A) was used as the basis for subsequent remedial investigations (RIs), which progressed to the development of RAs, including the remediation program at the M-5 Landfill. The Army conducted an RI of the site from May of 1997 through September of 1999. ATC was contracted by the Army to evaluate the data collected during the RI and to prepare the RAWP.

2.2.1 SI Report, 1995 – Roy F. Weston, Inc.

The SI performed by Weston in 1995 (Appendix A) at the M-5 Landfill included installation and sampling of two ground water monitoring wells (M-5MW10 [downgradient] and M-5MW11). Surface water sampling was not performed for the M-5 Landfill although surface water had previously been sampled in conjunction with the M-2 Landfill, which is upgradient. Two rounds of ground water sampling were performed and samples were analyzed for Target Compound List (TCL) plus 30 parameters (TCL+30), TAL metals, sulfate, and cyanide.

A background study of the Main Post Area was conducted as part of the SI. Five soil borings on the Main Post were completed in areas believed to be unaffected by base activities, as specified by the 1993 Weston SI Report. Two soil samples were collected from each of the five soil borings. The soil borings were converted to monitoring wells and two ground water samples were collected from each well. Two sediment and surface water samples were also collected as part of the background study. Maximum background concentrations were then established and reported in the SI Report for soil, ground water, surface water and sediment for the Main Post Area of Fort Monmouth so they could be compared to any future laboratory analytical results.

Ground water analytical data for one ground water monitoring well indicated that PCE concentrations exceeding the NJDEP GWQS of 1 µg/L were identified at the M-5 Landfill in monitoring well M-5MW11. Concentrations of sulfate or cyanide did not exceed the NJDEP GWQS. Fourteen metals were detected in site ground water; however, only four (aluminum, iron, manganese, and sodium) were identified at concentrations exceeding the NJDEP GWQS, but were detected at concentrations less than the maximum background concentrations established in the 1995 Weston SI Report and were, therefore, not identified as COCs.

The Weston SI Report (1995) presented a proposal to the Army for the M-5 Landfill that was subsequently implemented. A long-term ground water and surface water monitoring program was proposed utilizing the existing ground water monitoring wells and surface water sampling locations to monitor and document downgradient surface water and ground water quality conditions with time.

As requested by the NJDEP, an expanded SI identified PCE as the only COC in ground water at the M-5 Landfill. In 1998, the Army installed three additional ground water monitoring wells (M-5MW12, M-5MW13, and M-5MW14) as part of the expanded SI. This resulted in the performance of an RI encompassing soil and ground water characterization to determine the extent of the impact of PCE at the site.

2.2.2 Remedial Action Work Plan (RAWP), 2000 – ATC Associates Inc.

ATC submitted an RAWP to Fort Monmouth in February of 2000 (Appendix A). The Army performed an RI of the M-5 Landfill from April 1995 through September 1999. ATC was contracted by the Army to install additional ground water monitoring wells, evaluate data

collected during the RI, and prepare an RAWP.

The following RI approach was established:

- Performance of a Geoprobe® investigation of the soils and ground water within the landfill and surrounding areas to characterize near surface and subsurface soils and shallow ground water and determine whether a source area existed for the PCE observed in ground water.
- Installation of additional ground water monitoring wells within the landfill and surrounding areas and performance of constant discharge pump tests to determine the aquifer characteristics of the shallow saturated zone at the M-5 Landfill.
- Incorporation of new wells into the quarterly ground water monitoring and sampling program.
- Continuation of quarterly surface water sampling to evaluate potential impact to the stream from the PCE detected in the soils and shallow ground water.

Geoprobe® Investigation

The RI involved the drilling of 261 Geoprobe® locations for the collection of soil and ground water samples. The results of the RI indicated that PCE was detected at concentrations greater than the method detection limit (MDL) in seven of the soil borings and at concentrations exceeding the NJDEP Impact to Ground Water Soil Cleanup Criteria (IGWSCC) of 1 milligram per kilogram (mg/kg) in five samples. PCE was detected in ground water samples collected from 105 boring locations at concentrations exceeding the NJDEP GWQS for PCE of 1 µg/L.

Eight VOCs (PCE, TCE, *cis*-1,2-DCE, chlorobenzene, benzene, toluene, ethylbenzene, and total xylenes) were detected in ground water samples; five of which (PCE, TCE, *cis*-1,2-DCE, chlorobenzene, and benzene) were identified in ground water at concentrations exceeding their respective NJDEP GWQS. PCE concentrations greater than the NJDEP GWQS were detected in 105 samples. TCE (six samples), *cis*-1,2-DCE (10 samples), chlorobenzene (five samples), and benzene (nine samples) were detected at concentrations greater than their respective NJDEP GWQS.

Monitoring Wells

A total of 15 ground water monitoring wells, consisting of three (M-5MW10, M-5MW11, and M-8MW12) installed by Weston (1995), three (M-5MW12, M-5MW13, and M-5MW14) installed by the Army (1998), and nine (M-5MW15, M-5MW16, M-5MW18, M-5MW19, M-5MW20, M-5MW23, M-5MW25, M-8MW23, and M-8MW24) installed by ATC (1999) have been incorporated into the ground water monitoring program at the M-5 Landfill. Monitoring well depths range from 14 to 20 feet below ground surface (bgs). Ground water analytical results from the permanent monitoring wells identified PCE as the only COC at the M-5 Landfill. Although PCE concentrations were expected to naturally attenuate and decrease to NJDEP

GWQS with time, the Army proposed to actively remediate the affected areas at the M-5 Landfill by targeting seven specific locations and applying HRC®.

2.2.3 Remedial Action Progress Report (RAPR), 1999-2002 – Versar, Inc.

After the first and second HRC® injections and 12 rounds of ground water monitoring well sampling (4th Quarter of 1999 through the 3rd Quarter of 2002), Versar prepared an RAPR dated April 2003 (Appendix A). The RAPR documented ground water quality conditions with time and evaluated the impact of the HRC® injection program.

The initial injection of HRC® was performed between October and December of 2000 and the second was performed between February and May of 2002. These injection events were completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule.

A decreasing trend in PCE concentrations and an increase in degradation byproduct concentrations in ground water were observed during the reporting period (4th Quarter of 1999 through the 3rd Quarter of 2002). Ground water analytical results supported the contention that COC degradation was occurring at the M-5 Landfill, presumably due to the effectiveness of the HRC® injection program which supported biodegradation processes.

Based upon the COC concentration in ground water following the HRC® injections, the HRC® subsurface injection program was continued by the Army.

2.2.4 Remedial Action Progress Report (RAPR), 2002-2003 – Versar, Inc.

The third HRC® injection round was performed by the Army between June and August of 2003. This injection event was completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule. Versar prepared a second RAPR dated September 2005 (Appendix A) following the third injection event for the reporting period (4th Quarter of 2002 through the 3rd Quarter of 2003) which documented ground water quality conditions with time and evaluated the effectiveness of the HRC® injection program.

A decreasing trend in PCE concentrations was observed in ground water at the site throughout the four quarters of ground water sampling. Ground water analytical results supported the contention that PCE degradation was occurring at the M-5 Landfill, presumably due to the effectiveness of the HRC® injection program at supporting biodegradation processes.

Based upon the decreasing concentrations of the COC and increased presence of degradation products in ground water during the reporting period, the HRC® subsurface injection program was continued.

2.2.5 Remedial Investigation Report (RIR) and Sediment Quality Evaluation (SQE), 2004 – Versar, Inc.

To determine potential polychlorinated biphenyl (PCB)-related impacts to sediments in Mill Creek from the adjacent M-5 Landfill, the Army collected 16 sediment samples, including three duplicate samples for quality assurance/quality Control (QA/QC) purposes, on April 13, 2000 from the surface and near surface of Mill Creek. The sediment samples were collected along the 570-foot section of the creek that borders the M-5 Landfill. All 16 sediment samples were analyzed for PCBs and compared to sediment sampling guidance concentrations defined in the NJDEP's November 1998 *Guidance for Sediment Quality Evaluations*.

Only one of the 16 sediment samples (0.054 mg/kg, B-2, zero to six inches bgs) had total PCBs detected greater than the laboratory MDL. This sampling result also exceeded the NJDEP's Effect Range-Low (ER-L) guidance concentration for total PCBs, which represents the concentration at which adverse benthic effects are found in approximately 10% of studies. Other guidance criteria were not exceeded. Analysis of the remaining 15 samples, including upgradient samples, did not indicate PCBs at concentrations exceeding the laboratory MDLs. Given that the result at boring B-2 exceeded only the ER-L guidance concentration and the proximal upgradient samples were ND for total PCBs, no long-term adverse benthic effects were expected in Mill Creek. The RIR and SQE dated January 26, 2004 are provided in Appendix A.

2.2.6 Remedial Investigation Report (RIR) for Near Surface Soils, 2004 – Versar, Inc.

The Army characterized the near surface soils using 254 borings installed at strategic locations throughout the site. The *RIR for Near-Surface Soils* dated March 16, 2004 is provided in Appendix A. The Army advanced soil borings and collected soil samples between September of 1998 and November of 1998. Soil samples were analyzed for TCL+30 parameters and TAL metals.

VOCs, semivolatile organic compounds (SVOCs), pesticides, PCBs, and metals were detected at concentrations exceeding the NJDEP's Residential Direct Contact Soil Cleanup Criteria (RDCSCC). An evaluation of the analytical results did not define a "source area" or level of contamination that necessitated the identification and evaluation of additional RAs. In most cases, either the calculated compliance average was less than the respective NJDEP RDCSCC or the exceedance was considered marginal. Due to the adoption of the Soil Remediation Standards in 2008, this item is further discussed in Section 3.1 of this report.

2.2.7 Remedial Action Progress Report (RAPR), 2003-2005 – VEETech P.C.

The fourth HRC® injection round was performed by the Army from June to August of 2004. This injection event was completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule. VEETech prepared another RAPR dated February 2009 for the reporting

period of the 4th Quarter of 2003 through the 3rd Quarter of 2005 which documented ground water quality conditions with time and evaluated the effectiveness of the HRC® injection program.

A decreasing trend in PCE concentrations was observed in ground water at the site throughout the eight quarters of ground water sampling. Ground water analytical results supported the contention that PCE degradation was occurring at the M-5 Landfill, presumably due to the effectiveness of the HRC® at supporting biodegradation processes.

Based upon the decreasing concentrations of the COC and increased presence of degradation products in ground water during the reporting period, the HRC® subsurface injection program was continued.

2.2.8 Remedial Action Progress Report (RAPR), 2005-2006 – VEETech P.C.

The fifth HRC® injection event was performed by the Army from September to December of 2005. This injection event was completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule. VEETech prepared another RAPR dated April 2009 (Appendix A) for the reporting period of the 4th Quarter of 2005 through the 3rd Quarter of 2006 which documented ground water quality conditions with time and evaluated the effectiveness of the HRC® injection program.

Overall, a decreasing trend of PCE concentrations was observed in ground water at the site throughout the four quarters of ground water sampling. The results supported the contention that PCE degradation was occurring at the M-5 Landfill, presumably due to the effectiveness of the HRC® at supporting biodegradation processes.

2.2.9 Remedial Action Progress Report (RAPR), 2006-2008 – VEETech P.C.

During the reporting period of the 1st Quarter of 2006 through the 4th Quarter of 2008, ground water monitoring identified concentrations of PCE, TCE, and vinyl chloride greater than NJDEP GWQS. PCE was detected greater than the NJDEP GWQS of 1 µg/L in five monitoring wells (M-5MW11, M-5MW16, M-5MW19, M-5MW20, and M-5MW23). TCE was detected greater than the NJDEP GWQS of 1 µg/L in four monitoring wells (M-5MW16, M-5MW19, M-5MW20, and M-5MW23); *cis*-1,2-DCE exceeded NJDEP GWQS in monitoring well M-5MW16 on September 13, 2006. Vinyl chloride was detected greater than the NJDEP GWQS of 1 µg/L in one monitoring well (M-5MW16).

During this reporting period, surface water samples were collected from three surface water locations used to monitor the M-5 Landfill and analyzed for VOCs. PCE and TCE were detected at one location, SS-15, exceeding NJDEP freshwater SWQS.

PCE concentrations have decreased in monitoring wells where concentrations were greater than

NJDEP GWQS prior to the first HRC® injection. VEETech recommended that the Army continue quarterly ground water and surface water monitoring and consider additional biological or chemical oxidation treatment events.

3.0 REMEDIAL ACTIVITIES

Sampling results documented in ATC's RAWP (February 2000) for the M-5 Landfill indicated shallow ground water concentrations of PCE exceeding NJDEP GWQS. Although the PCE concentrations in ground water were expected to decrease through natural degradation and attenuation, the Army implemented a HRC® injection program from October 2000 to December 2005 to actively remediate ground water contamination at the site. This bioremediation program involved treating seven areas identified in the RAWP where elevated concentrations of PCE were detected (Figure 3-1 – Bioremediation Area Map). HRC® injection was not conducted during the current reporting period of the 1st Quarter of 2009 through the 3rd Quarter of 2010.

No RAs were completed during this reporting period. In 2009, temporary monitoring point investigations were conducted on July 29, August 7 and 25, and September 8 and 9, when 12 ground water samples were collected from 11 locations. These locations were selected to determine the horizontal and vertical extent of dissolved COC concentrations exceeding NJDEP GWQS at monitoring wells M-5MW11 and M-5MW23.

Laboratory analyses indicated that three VOCs were identified as COCs: *cis*-1,2-DCE, PCE, and TCE. VOC concentrations exceeding NJDEP GWQS were detected in ground water samples collected from temporary monitoring points M-5TMP-6 and M-5TMP-7. These results indicate that the greatest concentrations of COCs are located near monitoring wells M-5MW05 and M-5MW11.

3.1 Landfill Cover Investigation

A landfill cover investigation was conducted to determine the dimensions of the M-5 Landfill. The study incorporated data concerning the redefined landfill area, depth of landfill cover, and the type and concentrations of COCs present as it relates to current applicable NJDEP Soil Remediation Standards (SRS). The complete M-5 *Landfill Cover Investigation Report* is included in Appendix B.

The majority of information summarized in the report was obtained from the *Remedial Investigation Report (RIR) for Near Surface Soils – M-5 Landfill*, Fort Monmouth, New Jersey, prepared by Versar, Inc. (Versar) dated March 15, 2004. The RIR summarizes a Remedial Investigation (RI) performed from April through August 1998 at the M-5 Landfill. Data presented in the Versar RIR were compared to the NJDEP's Residential Direct Contact Soil Cleanup Criteria (RDCSCC), in effect at that time. The same data were compared to the Nonresidential Direct Contact Soil Remediation Standards (NRDCSRS) due to the 2008 adoption of the SRS and the acknowledgement of the Fort that the landfill will be deed restricted for nonresidential uses.

The study was conducted in accordance with the NJDEP'S *Technical Requirements* to characterize near-surface soil and assess potential risks to human health and the environment.

The RI activities included the collection of 508 near-surface soil samples at 254 borings at the M-5 Landfill.

The majority of the M-5 Landfill boundaries were determined through the 1998 RI, a prior review of aerial photographs of the Post from 1940 to 1974, and a study conducted in 2009 that consisted of trenching. The 2009 investigation was undertaken in order to precisely delineate the perimeter of the M-5 Landfill. That effort involved trenching along the northern, eastern, and southern boundaries of the known landfill. The western boundary of the M-5 is Mill Creek; therefore, trenches were not performed along this boundary.

DEPTH OF COVER MATERIAL
Depth of cover material was derived from the logs for all 254 borings in 1998 and 11 trenches and one (1) boring excavated/performed between January and February 2009 for the primary purpose of delineating the boundaries of the M-5 Landfill. Soil boring logs and detailed trench logs show the depth of cover found at each boring and trench location.

Summary of Findings

a. The average depth of cover at the M-5 Landfill is 24.1 inches.
b. Depth of cover throughout the M-5 Landfill varies from a maximum of 72 inches (Trenches T-5, T-10 and T-11) to a minimum of zero cover (Borings 8, 9, 53, 66, 67, 75, 76, 162 and163).
c. 30.88% (80 out of 259) of boring/trench logs show depth of cover greater than 24 inches.
d. Approximately 34.36% of boring/trench locations (89 of 259) show cover greater than 20 inches.

Concentrations of SVOCs and metals exceeded the NJDEP NRDCSRS. A review of the analytical results did not define a “source area” or level of contamination that necessitated the identification and evaluation of potential remedial actions other than the permanent closure of the landfill.

3.2 Proposed Future Remedial Activities

In correspondence dated September 2, 2010 (provided in Appendix B), the Army requested authorization via Permit-by-Rule pursuant to the New Jersey Pollutant Discharge Elimination System, N.J.A.C. 7:14A-1 *et seq*., to permit the injection of RegenOx™ and HRC Advanced® into the subsurface in an effort to remediate COCs detected in ground water at the M-5 Landfill.

In an effort to reduce chlorinated hydrocarbon concentrations in ground water in the areas surrounding monitoring wells M-5MW11, M-5MW16, and M-5MW23, the Army proposes to conduct additional injections using RegenOx™. RegenOx™, a product manufactured by Regenesis, is an advanced chemical oxidation technology that directly oxidizes compounds while

its catalytic component generates a range of highly-oxidizing free radicals that destroy a range of target compounds including total petroleum hydrocarbons (TPHCs), chlorinated compounds, and oxygenates. RegenOx™ injections will generally follow the HRC® injection procedure described in the RIR/RAWP prepared by ATC Associates, and will be limited to areas encompassing only the three aforementioned ground water monitoring wells. The Army proposed the injection of RegenOx™ beginning at a depth of 15 feet bgs; injection rates will be greater than the rate of previous HRC® injections as previously approved by NJDEP. According to Regenesis, the rate of injection should be approximately 20-22 gallons/vertical foot.

The Army proposes to utilize RegenOx™ to treat the COCs in ground water. After treatment with RegenOx™, if COC concentrations exceed applicable NJDEP GWQS, the Army may opt to continue injections using RegenOx™ followed by low-cost accelerated bioremediation using Regenesis' controlled release compound product, namely HRC Advanced®.

HRC Advanced® contains a nontoxic food-grade polyactate ester which quickly undergoes a fermentation that produces hydrogen upon introduction into an aquifer. Hydrogen serves as an electron donor in a reductive dechlorination process. HRC Advanced® also contains fatty acids which ferment more slowly than the polyactate ester, thereby providing a controlled release supply of hydrogen over a longer period of time. The Permit-by-Rule for the RegenOx™/HRC Advanced® request is provided in Appendix B.

4.0 MONITORING AND SAMPLING ACTIVITIES

Quarterly ground water monitoring and surface water sampling continued from the 1st Quarter 2009 through the 3rd Quarter 2010 as part of the long-term monitoring (LTM) at the M-5 Landfill. Ground water samples were collected from 10 monitoring wells (M-5MW10 through M-5MW14, M-5MW16, M-5MW18, M-5MW19, M-5MW20, and M-5MW23) at the M-5 Landfill during seven quarterly sampling events. Two monitoring wells, M-5MW15 and M-5MW25, were last sampled on July 30, 2003.

Surface water samples were collected over seven rounds of sampling from 15 locations (SS-03, SS-05, SS-09, SS-11 through SS-15, SS-19, SS-21, SS-22, SS-24, SS-26, SS-27 and SS-28). During the current reporting period, surface water samples were collected from three locations along Mill Creek and Laferta Creek: SS-24 (upstream of M-5 Landfill), SS-5 (along the western boundary of M-5 Landfill), and SS-28 (downstream of M-5 Landfill).

Sampling was conducted by the Army in accordance with the established protocols as described in the Fort Monmouth Standard Sampling Operating Procedure (SOP No. SAM-0205, August 1999, Revision #1 January 2003, Revision #2 September 2004, Revision #3 January 2006, and Revision #4 April 2008), (Appendix C), and the NJDEP's August 2005 *Field Sampling Procedures Manual*. Ground water samples were analyzed for VO+15 (VOCs with a 15-peak library search) and TAL metals. Laboratory analyses of the samples were conducted at Fort Monmouth's Environmental Testing Laboratory (FMETL), an NJDEP-certified laboratory (Certification No. 13461).

4.1 Ground Water Monitoring

During this reporting period at the M-5 Landfill (1st Quarter 2009 through 3rd Quarter 2010), ground water was encountered at elevations ranging from 1.29 to 11.36 feet above mean sea level (msl). Static depth to water from the top of the monitoring well casings was measured on February 26, 2009, June 12, 2009, September 19, 2009, December 28, 2009, March 29 and 30, 2010, June 29 and 30, 2010, and September 29, 2010. Separate phase product was not observed in the 10 monitoring wells during this reporting period. Figure 2-2 – Site Layout Map illustrates the locations of the monitoring wells. Ground water elevation contour maps have been generated from the 1st Quarter 2010 through the 3rd Quarter 2010. Post-wide depth-to-water measurements were taken in lieu of site-specific measurements beginning in 2010 in order to produce better representations of ground water conditions. The Army proposal and NJDEP response to the Post-wide depth to water collection is provided in Appendix H. Ground water contour maps can be found in Appendices H through J. Please note that ground water contour maps were not generated for the four quarters of 2009. These data indicate that ground water flows in a general west to northwest direction. Depth-to-water measurements are summarized quarterly in Appendices H through J. NJDEP Contour Map Reporting Forms are presented in Appendices H through J, for each quarterly sampling event.

The contour maps indicate that shallow ground water underlying the M-5 Landfill generally flows to the west - northwest toward Mill Creek and Parkers Creek. Variations in ground water flow conditions were not observed during the current monitoring period.

4.2 Ground Water Sampling

Quarterly ground water sampling was conducted by the Army. Quality control samples for the monitoring period provided 10 method blanks, 10 trip blanks, 10 field blanks, and 7 duplicate samples.

Sampling equipment was decontaminated before and after each use. Following collection, the ground water samples were immediately placed in laboratory-supplied bottleware. Sample containers were labeled, sealed, packed in ice, and transported to FMETL under proper chain-of-custody procedures.

Appendices D through J include all associated ground water data, tables and figures specific to each sampling event (i.e., Appendix D is dedicated to all 1st Quarter 2009 sampling data). Each appendix includes Ground Water Elevation Summaries, Ground Water Contour Maps, Contour Map Reporting Forms, Ground Water Contour Reporting Summaries, Isoconcentration Maps, Isoconcentration Summaries, and full laboratory analytical data. (No Ground Water Contour Maps were produced for the 2009 events as the depth-to-water sampling was not conducted on concurrent days. Depth-to-water measurements were collected on a Post-wide basis starting in the 1st Quarter 2010. Considering the much larger number of data points, the Post-wide data are considered to be a better representation of ground water conditions.) For ease of navigation, an item list is provided within each Appendix.

Table 4-1 (Ground Water Sampling Summary) provides a summary of the ground water sampling activities at the M-5 Landfill.

4.3 Surface Water Sampling

Surface water sampling was conducted by the Army for the current reporting period as part of a base-wide surface water sampling program. A total of 105 surface water samples were collected over seven rounds of sampling from 15 locations (SS-03, SS-05, SS-09, SS-11, SS-12, SS-13, SS-14, SS-15, SS-19, SS-21, SS-22, SS-24, SS-26, SS-27 and SS-28). A Surface Water Sampling Location Map is provided in Appendix K. The samples were analyzed by FMETL. The results of these analyses are discussed below in Section 5.2.

Sampling equipment was decontaminated before and after each use. Surface water samples were collected and immediately placed in laboratory-supplied bottleware. Sample containers were labeled, sealed, packed in ice, and transported to the FMETL under proper chain-of-custody procedures.

All surface water sampling data along with supporting data are presented in Appendix K, including copies of the chain-of-custody forms, laboratory analytical data, a summary of surface water sampling activities for Surface Water Rounds 1 through 56 for all sampling points, sampling rounds, sampling identification numbers, stream sampling locations, collection/analysis dates, analytical parameters, and analysis method.

4.4 Types of Waste Generated and Disposal Methods

Waste types generated by the remedial activities included three-gallon polyethylene pails, polyethylene tubing, Teflon® bailers, mason string, and personal protective equipment. The pails were recycled and the other materials were disposed of in accordance with the Fort Monmouth Solid Waste Management Plan.

5.0 SAMPLING ANALYTICAL RESULTS

This section includes a summary discussion of the chemical characterization of the M-5 Landfill based upon the samples collected and analyzed for the current reporting period, including seven quarterly rounds of ground water monitoring well samples and seven rounds of surface water samples. Analytes detected in ground water or surface water samples at concentrations greater than their respective NJDEP GWQS are bolded and highlighted in the tables.

5.1 Ground Water Sampling Results

Summaries of the analytical results from the monitoring wells at the M-5 Landfill from the inception of LTM are summarized in Tables 5-1 through 5-12. Monitoring wells M-5MW15 and M-5MW25 were last sampled in July of 2003. Ground water summary tables include detected analytical results for the M-5 Landfill and are divided by monitoring well numbers and sampling dates. The characterization of ground water quality at the M-5 Landfill contains 56 quarterly ground water sampling events conducted from May of 1997 through September of 2010. Ground water results are compared to NJDEP GWQS and are presented in three different tabs (electronically) reflecting changes to NJDEP criteria. The first set of data is compared against the January 7, 1993 criteria; the next is when criteria changes occurred on November 7, 2005, followed by further criteria changes on July 27, 2007.

The results in the ground water summary tables include analyte detections as well as exceedances of NJDEP GWQS, which are bolded and shaded. VOCs, SVOCs, pesticides/PCBs, and metals are presented as required to summarize results for detected parameters. Detections are presented in the ground water sampling result summary tables as follows:

- Xylenes are reported as total xylenes (the sum of *o*-xylene and *m*,*p*-xylenes).
- Tentatively Identified Compounds (TICs) are added and reported as total concentrations for the sum of TICs detected for VOCs and SVOCs.
- Duplicate samples are provided after the respective primary sample.
- Low Flow sampling method results are identified as “LF”.
- A “J” value is a concentration exceeding the MDL but less than the reporting limit (RL) for VOCs, SVOCs, and pesticides/PCBs.
- Estimated Results (“ER”) are concentrations exceeding the MDL and less than the RL for metals.
- A “B” value is a compound detected in the sample and the associated blank sample.
- Sample suites that were discontinued are recorded in the footnotes along with a date of NJDEP Case Manager approval.
- If a particular sample suite or analyte was not detected in a monitoring well, the suite/analyte is not presented in the monitoring well summary table.

Ten monitoring wells (M-5MW10 through M-5MW14, M-5MW16, M-5MW18 through M-5MW20, and M-5MW23) at the M-5 Landfill were sampled during the current reporting period

(1st Quarter 2009 through the 3rd Quarter 2010) and analyzed for VOCs and TAL metals. Analyses for SVOCs, pesticides and PCBs were discontinued for monitoring wells at the M-5 Landfill starting with Round 26.

5.1.1 Volatile Organic Compounds (VOCs) and Semivolatile Organic Compounds (SVOCs)

During seven quarterly sampling events for the current reporting period from February 2009 through September 2010, four VOCs (*cis*-1,2-DCE, PCE, TCE, and vinyl chloride) were detected at concentrations exceeding their respective NJDEP GWQS.

Analytical results for five monitoring wells (M-5MW11, M-5MW16, M-5MW19, M-5MW20 and M-5MW23) sampled during the current reporting period exceeded NJDEP GWQS for PCE. Analytical results for four monitoring wells (M-5MW16, M-5MW19, M-5MW20, and M-5MW23) sampled during the current reporting period exceeded NJDEP GWQS for TCE. The concentration of vinyl chloride exceeded NJDEP GWQS in one monitoring well (M-5MW16), as did *cis*-1,2-DCE in M-5MW20. PCE was initially identified as the COC in the RAWP. PCE degradation byproducts, TCE, *cis*-1,2 DCE, and vinyl chloride have been identified as COCs in subsequent RAPRs submitted to the NJDEP.

A summary of results exceeding NJDEP GWQS in the current reporting period is presented on Table 5-13. Figure 5-1 – Ground Water Contaminant Distribution Map summarizes the analytical results for COCs on a site map.

SVOCs were not analyzed during the current reporting period.

5.1.2 Tentatively Identified Compounds (TICs)

During this reporting period, VO TIC concentrations in ground water did not exceed the NJDEP GWQS of 100 µg/L for individual compounds or 500 µg/L for total TIC concentrations. Table 5-14 summarizes the analytical results for the ground water VO TICs during this reporting period.

The only TIC detection during this reporting period was in the 3rd Quarter 2010 in M-5MW20 (7 µg /L). No other TICs were detected during this reporting period.

5.1.3 Metals

During the current reporting period, ground water was sampled and analyzed for metals in the 1st, 2nd and 3rd Quarters of 2010. Eleven metals were detected in the M-5 Landfill ground water samples. Two metals (antimony and arsenic) were detected at concentrations greater than their respective NJDEP GWQS. Nine metals (barium, beryllium, cadmium, chromium, copper, lead, nickel, mercury and thallium) were detected at concentrations in compliance with the

NJDEP GWQS.

Arsenic concentrations were detected greater than the NJDEP GWQS in monitoring wells M-5MW12, M-5MW13, M-5MW16, M-5MW18 and M-5MW19. The greatest arsenic exceedance was 6.40 µg/L, which is less than the maximum background concentration (89.3µg/L) for ground water established in the Weston (1995) Report.

Antimony concentrations were detected greater than NJDEP GWQS in all monitoring wells during the current reporting period. Antimony concentrations were below the maximum background concentration (20.7 µg/L) for ground water established in the Weston (1995) Report with the exception of M-5MW12 and M-5MW13 in the 3rd Quarter 2010 which had exceedances of 27.5 and 30.1 µg/L, respectively.

In the 1st Quarter 2010, the Army began sampling for metals utilizing low flow sampling methods. Low flow sampling is the preferred method of sampling for metals by the NJDEP as it causes minimal disturbance to water and sediments in the well and generally produces samples with lower turbidity compared to standard purge methods.

Due to quality control issues in the FMETL during the analysis of selenium throughout this reporting period, no results have been reported for this metal. Please note that metals were not analyzed for in 2009.

5.1.4 Pesticides/Polychlorinated Biphenyls (PCBs)

Pesticides/PCBs were not analyzed for during the current reporting period.

5.1.5 Ground Water Contaminants of Concern (COCs)

Volatile Organic Compounds (VOCs) - The following summarizes VOC concentrations detected greater than NJDEP GWQS during the current reporting period:

- PCE concentrations in M-5MW11 ranged from 0.69 (1st Quarter 2010) to 2.74 µg/L (2nd Quarter 2009). PCE concentrations exceeded the NJDEP GWQS of 1 µg/L in five of seven sampling rounds for the current reporting period. Figure 5-2 illustrates the PCE concentrations with time in monitoring well M-5MW11, including all quarters of LTM since May of 1997.
- PCE concentrations in M-5MW16 ranged from 1.36 (1st Quarter 2010) to 4.9 µg/L (4th Quarter 2009). PCE concentrations exceeded the NJDEP GWQS of 1 µg/L in all seven sampling rounds for the current reporting period. Figure 5-3A illustrates the PCE concentrations with time throughout the LTM in monitoring well M-5MW16.
- PCE concentrations in M-5MW19 ranged from ND (3rd Quarter 2009 and 2nd and 3rd Quarters 2010) to 3.17 µg/L (2nd Quarter 2009). PCE concentrations exceeded the NJDEP GWQS of 1 µg/L in two of seven sampling rounds for the current reporting

period. Figure 5-4A illustrates the PCE concentrations with time throughout the LTM in monitoring well M-5MW19.

- PCE concentrations in M-5MW20 ranged from 0.96 (4th Quarter 2009) to 11.13 µg/L (2nd Quarter 2010). PCE concentrations exceeded the NJDEP GWQS of 1 µg/L in six of seven sampling rounds for the current reporting period. Figure 5-5A illustrates the PCE concentrations with time throughout the LTM in monitoring well M-5MW20.
- PCE concentrations in M-5MW23 ranged from 1.76 (4th Quarter 2009) to 46.64 µg/L (3rd Quarter 2010). PCE concentrations exceeded the NJDEP GWQS of 1 µg/L in all seven sampling rounds for the current reporting period. Figure 5-6A illustrates the PCE concentration with time throughout the LTM in monitoring well M-5MW23.
- TCE concentrations in M-5MW16 ranged from ND (3rd and 4th Quarters 2009) to 1.84 µg/L (1st Quarter 2010). TCE concentrations exceeded the NJDEP GWQS of 1 µg/L in three of seven sampling rounds for the current reporting period. Figure 5-3B illustrates the TCE concentrations with time throughout the LTM in monitoring well M-5MW16.
- TCE concentrations in M-5MW19 ranged from ND (3rd Quarter 2009 and 3rd Quarter 2010) to 2.9 µg/L (1st Quarter 2009). TCE concentrations exceeded the NJDEP GWQS of 1 µg/L in one of seven sampling rounds for the current reporting period. Figure 5-4B illustrates the TCE concentrations with time throughout the LTM in monitoring well M-5MW19.
- TCE concentrations in M-5MW20 ranged from 0.30J (4th Quarter 2009) to 51.25 µg/L (2nd Quarter 2010). TCE concentrations exceeded the NJDEP GWQS of 1 µg/L in five of seven sampling rounds for the current reporting period. Figure 5-5B illustrates the TCE concentrations with time throughout the LTM in monitoring well M-5MW20.
- TCE concentrations in M-5MW23 ranged from ND (1st, 2nd, 3rd and 4th Quarters of 2009) to 2.62 µg/L (3rd Quarter 2010). TCE concentrations exceeded the NJDEP GWQS of 1 µg/L in three of seven sampling rounds for the current reporting period. Figure 5-6B illustrates the TCE concentrations with time throughout the LTM in monitoring well M-5MW23.
- *cis*-1,2-DCE concentrations in M-5MW20 ranged from 1.44 µg/L (4th Quarter 2009) to 111.95 µg/L (2nd Quarter 2010); cis-1,2-DCE concentrations exceeded the NJDEP GWQS of 70 µg/L in one of seven sampling rounds for the current reporting period. Figure 5-5C illustrates the *cis*-1,2-DCE concentrations with time throughout the LTM in monitoring well M-5MW20.
- Vinyl chloride concentrations in M-5MW16 ranged from ND (2nd, 3rd and 4th Quarters of 2009 and 1st and 3rd Quarters of 2010) to 1.28J µg/L (1st Quarter 2009). Vinyl chloride concentrations exceeded the NJDEP GWQS of 1 µg/L in two of seven sampling rounds for the current reporting period. Figure 5-3C illustrates the vinyl chloride concentrations with time throughout the LTM in monitoring well M-5MW16.

All other monitoring wells had *cis*-1,2-DCE, PCE, TCE, and vinyl chloride concentrations that were ND or less than their respective NJDEP GWQS.

Metals - The metals identified as exceedances of NJDEP GWQS are not considered to be COCs

as they are naturally occurring metals within the soils on the Fort and no source areas are apparent. A discussion of background metals concentrations is provided in Section 6.0 of this RAPR.

5.1.6 Ground Water - Quality Assurance/Quality Control (QA/QC)

To verify the reliability of ground water analytical results, a review of the holding times for each sample and the results of the analyses for 10 method blanks, 10 trip blanks, 10 field blanks, and seven field duplicate samples was conducted. The discussion below is based upon QA/QC for the ground water samples. Samples were analyzed by the FMETL within the prescribed holding time requirements for the analytical method.

Method Blanks

Laboratory method blanks accompanied each batch of samples for the M-5 Landfill. These method blanks consisted of laboratory-grade water that was processed identically to the samples and analyzed with the sample batch. A total of 10 method blanks were analyzed with the M-5 Landfill samples.

No VOCs were detected in the method blanks.

Trip Blanks

A total of 10 trip blanks were provided as part of the M-5 Landfill sampling program to document that VOCs were not introduced into the samples during the handling process. The trip blanks were prepared by the FMETL and consisted of sample bottles filled with laboratory-deionized water. The trip blanks remained with the sample bottles in coolers and were returned to the laboratory for analyses along with the ground water samples.

Chloroform was detected in one of the 10 trip blanks at a concentration of 5.12 µg/L during the 3rd Quarter 2009. This detection did not exceed the NJDEP GWQS of 70 µg/L. Chloroform is a common laboratory contaminant and this single detection is not indicative of a widespread laboratory contamination problem. The detection of chloroform indicates that sample handling procedures, including sample containers, may have introduced contamination into the sampling and analysis processes.

No other VOCs or COCs were detected in the trip blank samples.

Field Blanks

One field blank sample was collected during each day's sampling activities to check for potential introduction of contaminants from the field sampling and equipment decontamination procedures. A total of 10 field blanks were collected during this reporting period of the M-5 Landfill sampling program. The field blanks were collected by pouring laboratory-deionized

water over the sampling equipment used for daily activities. The water was collected in clean laboratory-supplied containers and submitted for analysis along with the M-5 Landfill ground water samples.

Chloroform was detected in one of the 10 trip blanks at a concentration of 2.46 µg/L during the 3rd Quarter 2009. This detection did not exceed the NJDEP GWQS of 70 µg/L. Chloroform is a common laboratory contaminant and this single detection is not indicative of a widespread laboratory contamination problem. The detection of chloroform indicates that sample handling procedures, including sample containers, may have introduced contamination into the sampling and analysis processes.

No other VOCs or COCs were detected in the field blank samples.

Duplicate Samples

Ten field duplicate samples were also collected during the current reporting period for the M-5 Landfill sampling events to verify the consistency of the entire sampling and analytical procedure. The Relative Percent Differences (RPDs) for the duplicate sample analyses for VOCs ranged from zero (0) percent to 31.37 percent; and for metals, zero (0) percent to 13.70 percent (Table 5-15). The average RPDs for duplicate analyses for VOCs were 8.80 percent; and for metals, 8.68 percent. The RPDs for all sampling categories ranged from zero (0) percent to 31.37 percent with an average of 9.74 percent.

M-5 Ground Water Data Validation

Tetra Tech EM Inc. (Tetra Tech) conducted data validation for the M-5 Landfill. Data were evaluated for the following criteria: data completeness, sample preservation, receipt and holding times, gas chromatography and mass spectrometry (GC/MS) instrument performance checks, initial and continuing calibration, calibration verification, field, trip, and laboratory blanks, inductively coupled plasma–interference check sample (ICP-ICS), system monitoring compounds (surrogates), matrix spike/matrix spike duplicates (MS/MSDs), laboratory duplicate sample analysis, ICP serial dilution, field duplicates, laboratory control samples (LCSs), dilution, re-extraction and reanalysis, internal standards, target analyte identification, analyte quantitation, and reported detection limits. Data validation packages are provided in their respective appendices.

- Tetra Tech conducted data validation of the analytical results for 10 ground water samples, one field duplicate, one field blank, and one trip blank that were collected at the M-5 Landfill on December 28, 2009. The overall quality of this data package was acceptable. Rejection of data was not required for this data package. The VOC data were qualified because of minor calibration irregularities and results less than the laboratory RLs but greater than the MDLs. All data can be used as qualified.

- Tetra Tech conducted data validation of the analytical results for 10 ground water samples, one field duplicate, two trip blanks, and two field blanks, which were collected at the M-5 Landfill on June 29 and 30, 2010 as part of the 2nd Quarter 2010 LTM project. The overall quality of the data was acceptable. For sample M-5MW20, the undiluted result for *cis*-1,2-DCE and the diluted results for the remaining VOCs were rejected as unusable for the reason that in the initial VOC analysis of Sample M-5MW20 the concentration of *cis*-1,2-DCE exceeded the calibration range. The sample was reanalyzed at a five-fold dilution, which brought the concentration of that compound within the calibration range. Both sets of results are given in the written report (Appendix I), but the original (undiluted) result for *cis*-1,2-DCE is rejected (flagged "R") and the diluted results for all other analytes are rejected. This leaves one reported result for each VOC analyte in that sample. All data, except for the rejected VOC results, may be used as qualified.

5.2 Surface Water Sampling Results

Quarterly surface water samples were collected at 15 locations during the current sampling period (Surface Water Sampling Rounds 50 through 56). Results for surface water samples from the inception of the LTM are summarized in Appendix K. Surface water summary tables include detected analytical results for the surface water sample locations and are divided by surface water sample numbers and sampling dates.

A total of seven quarterly surface water sampling events were conducted from March of 2009 through September of 2010. The surface water sampling results from the base-wide sampling program were compared to NJDEP freshwater SWQS. Concentrations of VOCs, metals, and wet chemistry exceeding their respective NJDEP freshwater SWQS are summarized in Appendix K. Surface water COC distributions with time are presented in Appendix K. The results of the current surface water sampling events are discussed below.

The results in the surface water summary tables include analyte detections as well as exceedances of NJDEP freshwater SWQS, which are bolded and shaded. VOCs, metals, and wet chemistry parameters are presented as required to summarize results for detected parameters. Detections are presented in the surface water sampling result summary tables as follows:

- Xylenes are reported as total xylenes (the sum of *o*-xylene and *m*,*p*-xylenes).
- TICs are added and reported as a total concentration for the sum of TICs detected for VOCs.
- Duplicate samples are provided after the respective primary sample.
- A "J" value is a concentration exceeding the MDL but less than the RL for VOCs.
- Estimated Results ("ER") are concentrations exceeding the MDL and less than the RL for metals.
- A "B" value is a compound detected in the sample and its associated field blank sample.
- If a particular sample suite or analyte was not detected in a surface water sample location,

the suite/analyte is not presented in the summary table.

5.2.1 Volatile Organic Compounds (VOCs)

During seven quarterly sampling events for the current reporting period, four VOCs (bromodichloromethane, PCE, TCE, and vinyl chloride) were detected at concentrations exceeding their respective NJDEP SWQS.

Appendix K includes a summary of the analytical results which exceeded NJDEP SWQS during the current reporting period.

5.2.2 Tentatively Identified Compounds (TICs)

During this reporting period, VO TICs were periodically detected at low level concentrations at seven of the 15 total locations. For purposes of comparison, concentrations were compared to NJDEP GWQS as there are no NJDEP SWQS for VO TICs.

Surface water TICs did not exceed either the NJDEP GWQS of 100 µg/L for an individual compound or 500 µg/L for total TIC concentrations during the current reporting period (Appendix K).

5.2.3 Metals

Four metals (antimony, arsenic, lead, and mercury) were detected at concentrations exceeding their respective NJDEP SWQS.

Appendix K includes a summary of the analytical results which exceeded NJDEP SWQS during the current reporting period.

5.2.4 Pesticides

Pesticides were not analyzed for during the current reporting period.

5.2.5 Surface Water Contaminants of Concern (COCs)

During the current reporting period, surface water samples were collected from three locations along Mill Creek and Laferta Creek: SS-24 (upstream of M-5 Landfill), SS-5 (along the western boundary of M-5 Landfill), and SS-28 (downstream of M-5 Landfill). PCE concentrations exceeded NJDEP SWQS in SS-5, SS-24, and SS-28. TCE concentrations exceeded NJDEP SWQS in SS-24. Although PCE and TCE were detected at concentrations exceeding NJDEP SWQS, the location and distribution of COCs suggests that the M-5 Landfill is not the probable source for these VOCs.

5.2.6 Surface Water – Quality Assurance/Quality Control (QA/QC)

To verify the reliability of surface water analytical results, a review of the holding times for each sample and the results of the analyses of nine method blanks, seven trip blanks, seven field blanks, and seven field duplicate samples was conducted. The discussion below is based upon QA/QC for the VOC surface water samples. Samples were analyzed by the FMETL within the prescribed holding time requirements for the analytical method.

Method Blanks

Laboratory method blanks accompanied each batch of surface water samples for each Main Post surface water sampling event. These method blanks consisted of laboratory-deionized water that is processed identically to the samples and analyzed with the sample batch. A total of nine VOC method blanks were analyzed with the base-wide surface water samples.

No VOCs were detected in the method blank samples.

Trip Blanks

A total of seven trip blanks were provided as part of the base-wide surface water sampling program to document that VOCs were not introduced into the samples during the handling process. The trip blanks were prepared by the FMETL and consisted of sample bottles filled with laboratory-deionized water. The trip blanks remained with the sample bottles in coolers and were returned to the laboratory for analyses along with the surface water samples.

Methylene chloride was detected in one of the seven trip blanks at a concentration of 15.28 µg/L, which is greater than the NJDEP Freshwater SWQS of 2.5 µg/L and less than the NJDEP saline SWQS of 310 µg/L. Methylene chloride is a common laboratory contaminant and its detection is not indicative of a widespread laboratory contamination problem. The detection of methylene chloride indicates that sample handling procedures, including sample containers, may have introduced contamination into the sampling and analysis processes.

No COCs were detected in the trip blank samples.

Field Blanks

One field blank sample was obtained during each day's sampling activities to document equipment decontamination procedures. A total of seven field samples (e.g., field blanks) were collected during the base-wide surface water sampling program. The field blanks were collected by pouring laboratory-deionized water over the sampling equipment used for daily activities. The water was collected in clean laboratory-supplied containers and submitted for analysis along with the surface water samples.

Methylene chloride was detected in one of seven trip blanks at a concentration of 2.18 µg/L, which is less than the NJDEP Freshwater SWQS of 2.5 µg/L and NJDEP saline SWQS of 310 µg/L. As noted for the trip blanks, the detection of methylene chloride may indicate that sample handling procedures, including sample containers, may have introduced contamination into the sampling and analysis processes.

No COCs were detected in the field blank samples.

Duplicate Samples

A total of seven field duplicate samples were also collected during the base-wide surface water sampling events to verify the consistency of the entire sampling and analytical procedures.

The results for the duplicate samples were similar to those obtained for the original samples. The RPDs for the duplicate sample analyses ranged from 0 to 21.51%; however, the average RPD for the seven duplicates was 13.65%. Based upon average RPDs, the QA/QC sampling results indicate a high level of precision.

Surface Water Data Validation

Tetra Tech conducted data validation for the Main Post surface water sampling results. Data was evaluated for the following criteria: data completeness, sample preservation, receipt and holding times, GC/MS instrument performance checks, initial and continuing calibration, calibration verification, field, trip, and laboratory blanks, ICP-ICS, system monitoring compounds (surrogates), MS/MSDs, laboratory duplicate sample analysis, ICP serial dilution, field duplicates, LCSs, dilution, reextraction and reanalysis, internal standards, target analyte identification, analyte quantitation, and reported detection limits.

- Tetra Tech conducted data validation of the analytical results for 15 surface water samples, one field duplicate, one field blank, and one trip blank that were collected at various Stream Sites (abbreviated to "SS" in the sample designations) on December 7, 2009. The overall quality of this data package was acceptable. Rejection of data was not required for this data package. The VOC data were qualified because of minor calibration irregularities and results less than the laboratory RLs but greater than the MDLs. Metals results were qualified for calibration verification irregularities, blank contamination, a result greater than the linear range of the instrument, and results less than the laboratory RLs but greater than the MDLs. All data can be used as qualified.

- Tetra Tech conducted data validation of the analytical results for 15 surface water samples, one field duplicate, one trip blank, and one field blank, that were collected on June 22, 2010 as part of the 2nd Quarter 2010 LTM project. Tetra Tech concluded that the overall quality of the data was acceptable. No results were rejected. All data can be used as qualified.

6.0 BACKGROUND METALS EVALUATION

Historically, ground water samples from monitoring wells throughout Fort Monmouth's Main Post and the Charles Wood Area have periodically displayed concentrations of metals that exceed NJDEP GWQS. Some of the metals have been retained as COCs while characterization has continued. However, it has long been believed that the metal detections represent materials derived from the native soil as a background condition in the local region.

Brinkerhoff Environmental Services (2011) noted the likelihood that metal results reflected the presence of high turbidity in samples (see Appendix L). In addition, the analysis of glauconitic clay (see Appendix L) indicates that the clay contains a metal fingerprint that mirrors that found in turbid ground water samples, suggesting the fines from the native clays are the source of the turbidity and that the metals are derived from acid extraction of the metals on those fines when subjected to the preservatives added to the sample vials.

The Army has conducted additional analysis of available data and concludes that the metals heretofore designated as COCs in ground water are, in fact, native materials associated with clay fines in the samples. The following describes the approach taken and the conclusions drawn from the results of the analyses.

6.1 Evaluation Approach

In the past, each site at Fort Monmouth has been evaluated on its own merits with respect to COCs and risk. However, it has become very clear that the apparent metals issue is ubiquitous and would benefit from a base-wide analysis. Pursuant to that, a review was made of all historical groundwater sampling data to help put metal results in perspective. In the Brinkerhoff background analysis (2011), it was concluded that there were no sources for any of the metals observed in ground water, with the possible exception of lead. Because there were potential sources of lead present at Fort Monmouth (but not specifically associated with any individual site), Brinkerhoff chose not to rule out the possibility that some of the metals found in ground water could be the direct result of a release. At the same time, Brinkerhoff found a direct correlation between arsenic concentrations and lead concentrations, despite there being no potential source of arsenic releases. The obvious implication of that finding is that lead, as well as arsenic, arises from its presence in native soil. As a consequence, the Army has focused its analysis primarily on lead.

The review focused on the following areas:

- Nature of apparent sources
- Relationship of metals levels to turbidity
- Extreme variability in field duplicate results
- History of atypical spikes

6.1.1 Nature of Apparent Sources

A review of monitoring data over the life of the environmental restoration program at Fort Monmouth reveals that virtually every monitoring well at one time or another has had a metal concentration that has exceeded NJDEP GWQS. Given the diverse nature of activities and the location of the monitoring wells, this suggests a common factor across sites other than the activities that might have resulted in releases. Specific to lead contamination, sites with heating oil tanks and lime pits are unlikely sources of a release. Not only is lead not present as an additive in heating oil, but the characteristics of the lime pit should reduce the solubility of lead, not increase it. Lead is mobilized by acidity, not by basic conditions.

When the review is expanded to all metals, there is a consistent pattern of observations despite the nature of the Army's activities as seen in Table 6-1. Moreover, the metals observed (antimony – Sb; arsenic – As; beryllium – Be, cadmium – Cd, chromium – Cr; lead – Pb; and nickel – Ni) are all present in glauconitic clay. Metal observations in ground water are consistent, despite the disparate nature of the Army's activities at the sites being monitored.

Table 6-1
Metal Observations in Ground Water Are Consistent, Despite the Disparate Nature of the Army's Activities At the Sites Being Monitored

Site	Release Type	Location	Other COCs	Metals > NJGWQS (Bkgd)
FTMM-14, M-14 Landfill	Landfill	Main Base, Central		Sb, As, Be, Cd, Pb, Th
FTMM-03, Landfill M-3	Landfill	Main Base, North Central	VOC	Sb, As, Cd, Pb
Building 750	Heating Oil USTs	Main Base. South Central		Sb, As, Be, Cd, Cr, Pb, Ni
FTMM-18, 54, 55, 62	Landfill, USTs, Fuel area	Main Base, North Central	Benzene	Sb, As, Be, Cd, Pb
FTMM-25, Landfill CW-3A	Landfill	Charles Wood, South		Sb, As, Be, Cd, Cr, Pb
FTMM-28, Pesticide Spill Location	Pesticide Spill, USTs Fuel Area	Charles Wood, Central		As, Pb, Cd, Sb, Sl, Th
FTMM-04, Landfill M-4	Landfill	Main Base, West Central		Sb, As, Be, Cd, Pb, Th
FTMM-12, M-12 Landfill	Landfill	Main Base, Central		Sb, As, Be, Cd, Pb, Th
FTMM-66, Building 866	Heating Oil AST	Main Base, South Central	Methyl Napthalene,	Sb, As, Cd, Pb

			Benzene, BEHP	
FTMM-58, Building 2567	Active Gas Station	Charles Wood, East Central	Tert Butyl Alcohol	Sb, As, Pb
FTMM-56, Buildings 80-166	Heating Oil UST	Main Base, East	Chlordane, DDD, DDE	Sb, As, Be, Cd, Pb, Th
FTMM-22, Building CW-1	Lime Pit	Charles Wood, West	TCE	Sb, As, Pb
FTMM-57, Building 108	Heating Oil UST	Main Base, East		Sb, AS, Pb

6.1.2 Relationship of Metal Levels to Turbidity

Brinkerhoff Environmental Services' *Report on Background Metals* (2011) notes in Section 4.2 that there has been a historic problem with turbid samples and the subsequent dissolution of metals from native soil by the nitric acid preservative used on samples intended for metals analysis. In a background study of the glauconite-rich soil at Fort Monmouth, researchers noted concentrations of 16 mg/kg lead (March 9, 2011 letter from U.S. Army to Larry Quinn). Turbidity is exacerbated by purge techniques in formations with fine soil particles, but can also be a problem with low-flow sampling as noted in Tetra Tech's January 2010 Data Validation Report in which some field duplicates had RPDs for metals that exceeded QC criteria (e.g., 80MW03 on 2/24/2010).

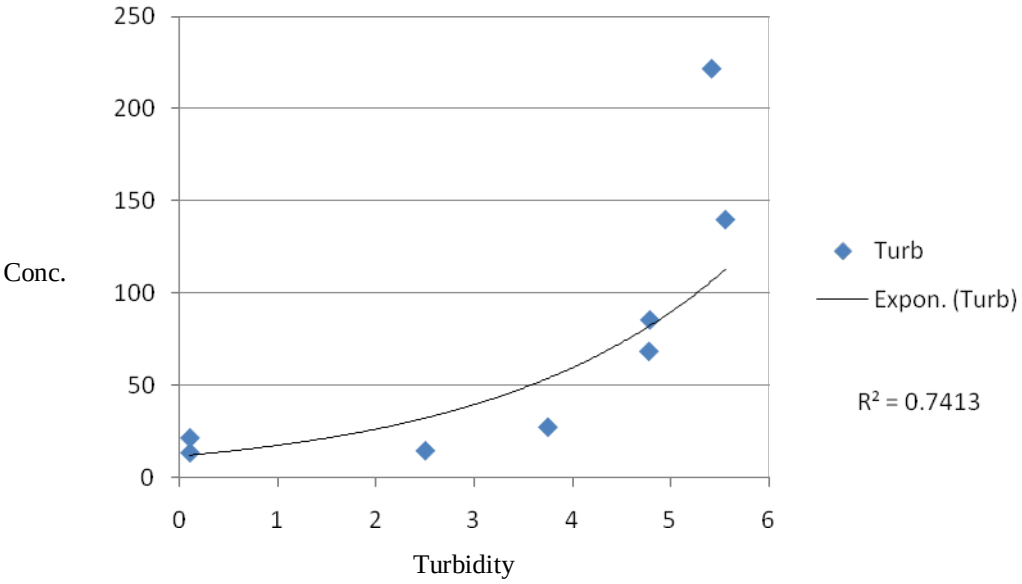
Turbidity data have not been reported for most historic samples. However, turbidity has been measured since implementation of low-flow sampling techniques in 2010. In general, samples should have turbidity < 5 units for a sample to yield results representative of dissolved metals. The data presented in Table 6-2 summarize turbidity levels for samples taken from various sites at Fort Monmouth in 2010. Clearly, turbidity remains a problem, despite the use of low-flow sampling. Occurrence of turbidity in excess of 5 NTU in 2010 samples have continued despite the use of low-flow sampling techniques.

Table 6-2
Occurrence of Turbidity In Excess of 5 JTU in 2010 Samples Have Continued, Despite Use of Low Flow Sampling Techniques

Site	Turbidity (NTU) **Bold XX** – Value is in excess of 5 NTU										
	MW01	MW02	MW03	MW04	MW05	MW06	MW07	MW08	MW09	MW10	MW11
FTMM-57 (Q2)	**9.16**	**10.3**	4.16	**37.4**							
FTMM-03 (Q1)				0.28	**15.6**	4.64	**7.63**	4.83	**12.4**	**10.8**	2.28
FTMM-03 (Q2)				3.61	**11.7**	**10.3**	**6.02**	**11.5**	**7.54**	2.13	1.82
FTMM-18/54/55/62 (Q2)	2.14	**16.8**	1.67	**11.3**		**6.17**	**34.5**	**13.3**			
FTMM-04 (Q1)							3.65	**36.6**	**7.68**	1.43	
FTMM-04 (Q2)							2.81	**24.3**	**6.17**	2.7	
FTMM-66 (Q2, RW wells)	**14.4**	**222**	13.3	**140**	**85.5**	**68.4**	**21.4**	**27.2**			
FTMM-58 (Q1)	**38.1**	**11.5**	**8.67**	**22**	**9.4**	**21.6**	**6.88**				
FTMM-58 (Q2)	0.58	**6.17**	**10.2**	**5.54**	**35.7**	**16.8**	**8.17**				
Well	MW16	MW17	MW18	MW19	MW20	MW21	MW22	MW23	MW24	MW25	MW26
FTMM-12	3.06	**5.65**	1.2	0.75	0.33	4.34	2.05	**5.61**	3.36	**5.22**	**9.72**

When the turbidity is high, there is a direct correlation between turbidity and lead concentrations as is evident from the data from Site FTMM-66 samples collected in May 2010 (Figure 6-1).

Figure 6-1
There is a Direct Correlation Between Turbidity and Lead Concentrations at FTMM-66 Using Low Flow Sampling Techniques



As one would expect, the introduction of low-flow sampling techniques has reduced metal concentrations reported in ground water samples at Fort Monmouth. A comparison of lead concentrations prior to and after implementation of the low-flow techniques is provided in Table 6-3. As is evident, lead concentrations decreased when low flow sampling was implemented. However, as presented in Table 6-2, turbidity issues are still present with low flow sampling and can still cause an apparent elevation in lead levels.

Table 6-3
There Has Been a Clear Reduction in Lead with Use of Low Flow Sampling Techniques, Despite Continued Presence of High Turbidity

Site	Lead Concentration (ug/L) Pre-Low Ave/Low Flow Ave

6.1.3 Extreme Variability in Metal Content of Field Duplicate Samples

In accordance with standard quality control/quality assurance protocol, field duplicate samples were collected throughout the performance of monitoring work at Fort Monmouth. Pursuant to the Quality Assurance Project Plan for Fort Monmouth, whenever samples are found to have a

relative percent difference (RPD) of greater than 25% for metals, the data quality is suspect. An examination of the RPD values for ground water samples at Fort Monmouth reveals that a significant number of the duplicates collected from wells across the installation have RPD values well in excess of 25%.

Table 6-4
A Significant Percentage of the Field Duplicates Collected at Fort Monmouth Yielded RPD for Lead in Excess of the Quality Control/Quality Assurance Threshold Value of 25%

The presence of turbidity is the most common cause of poor RPD performance when metals are the analyte. Simply put, suspended solids that cause turbidity in water samples are heterogeneous by nature and when the sample is split, there is no way to divide them evenly so that both samples obtain the same amount of solids, let alone an evenly divided sampling of the different solid particle types that may be present. A single particle of mineral origin can have sufficient metal content to dramatically affect the RPD.

6.1.4 Occurrence of Atypical Spikes

Metals generally move slowly in ground water, both because of the slow velocity of the water itself and because of interactions with the soil that retard their movement. As such, time frames are sufficient for dispersion and diffusion to give rise to classic Gaussian plumes that display first order concentration gradients. When samples collected in sequential quarters differ in concentration by more than an order of magnitude, it suggests that at least one of the two values does not represent dissolved metal content and is more likely to be the result of acid extraction from suspended solids in the sample. Atypical spikes noted in historic monitoring results are presented in Table 6-5.

Table 6-5
Historical Data from Fort Monmouth Show Rapid Increases and Decreases in Lead Concentrations That Cannot Be Attributed to Dissolved Metals

6.2 Conclusion of Base-Wide Evaluation of Metals As Contaminants of Concern

The only consistent explanation for lead findings to date (and other metals as well) is that fine particles of glauconitic clay are suspended in many of the samples and yield metals when contacted with the acid preservative used for ground water samples. The applicability of each of these factors to individual sites at Fort Monmouth is summarized in Table 6-6.

Table 6-6
All Sites with Historic Lead Occurrences Have One or More Clear Markers Suggesting Turbidity is the Source of the Lead

Site and Use	Most Recent Lead Con Range in ug/L (date)	Percent of Low Flow Samples with Turbidity > 5 NTU	Affect of Low Flow (Ave Post/Pre)*	% of RPD** > 25 (Maximum RPD)*	# Atypical Spikes (Max Value in ug/L)

*Based on setting ND samples at 1 ug/kg
**If both duplicates were ND or if one was ND and the other <2 ug/L, the duplicate was not evaluated

Given the weight of evidence, the Army has concluded that metal detections in general, and lead specifically, are the direct result of acid leaching of suspended solids in ground water samples. Therefore, metals are not considered COCs. This is further supported by the location of the Wenonah Mount Laurel aquifer, which is approximately 125 feet bgs - too deep to be affected by the presence of these metals near ground surface. In addition, the sensitive receptor survey (Appendix M) indicated no domestic or irrigation wells are close enough to be adversely impacted by COC migration.

7.0 RECEPTOR EVALUATION

7.1 Sensitive Receptor and Well Search

A visual and documentary search of sensitive populations was performed the Army and their subcontractor to identify potentially sensitive populations within 200 feet of the FTMM boundary. The identification of said populations is in accordance with NJDEP statutory requirements. The Receptor Evaluation Report, NJDEP Sensitive Receptor Survey Form, and Sensitive Receptor Survey figure are provided in Appendix M.

Although the identified populations are within 200 feet of the FTMM boundary, all of the environmentally-impacted locations are an appreciable distance from the fence line and in all cases exceed the 200-foot buffer established by NJDEP. In addition, site-specific utility maps were reviewed to identify any preferential pathways which could affect site contamination plumes. These maps are provided in Appendix M.

In addition to the sensitive receptors, the Army has included all identified off-site wells within 2,000 feet of the FTMM perimeter. No production wells were identified within 2,000 feet of the FTMM boundary. The majority of off-site wells are monitoring wells associated with various remedial activities. A ground water model has been developed for FTMM, with the overall ground water flow pattern for the Main Post being easterly with a localized northeasterly component. FTMM is bounded by surface water bodies to the east and northeast. Domestic and/or irrigation wells to the east or northeast of the Main Post would not be impacted by activities on FTMM property.

Surface water bodies interact with ground water at FTMM. The interaction takes place in three basic ways: streams gain water from inflow of ground water through the streambed, streams lose water to ground water by outflow through the streambed, or both, gaining in some reaches and losing in other reaches. When ground water discharges into a surface water body, the elevation of the ground water table in the vicinity of the surface water body must be higher than the elevation of the stream water surface. Conversely, for surface water to seep to ground water, the elevation of the water table in the vicinity of the stream must be lower than the elevation of the stream water surface. The surface water bodies at FTMM (Oceanport and Parkers Creeks) may be gaining or losing depending upon the tidal cycle. Throughout the entire tidal cycle however, net results are that ground water inflows into the creeks, albeit at low flow rates. Figures depicting the surface water features, wetland areas, and stream bank stabilization areas in the vicinity of the Site are included in Appendix M.

7.2 Vapor Intrusion (VI) Investigation

FTMM evaluated the requirements for a VI assessment in accordance with the NJDEP's October 2005 Vapor Intrusion Guidance (VIG) and *Technical Requirements.* FTMM utilized the three-stage assessment criteria as detailed in the VIG decision framework to determine the

applicability of VI regulations. Site-specific ground water data from the seven most recent quarterly ground water sampling events were compared to the NJDEP Ground Water Screening Levels (GWSLs). Given that PCE, TCE, and vinyl chloride concentrations exceeded applicable NJDEP GWSLs and were identified within 100 feet of surrounding building(s), a vapor intrusion evaluation is warranted. All supporting documentation regarding the VI evaluation, including a figure depicting groundwater concentrations and distances are included in Appendix M.

7.3 Baseline Ecological Evaluation (BEE)

Shaw Environmental, Inc. was contracted by the Army to conduct a Baseline Ecological Evaluation (BEE) for Fort Monmouth's Main Post and Charles Wood Areas. Sampling of multiple media was conducted in 2010. The draft BEE was submitted in May 2011 and will be updated once comments are resolved with NJDEP.

7.4 Public Notification

In accordance with Public Notification requirements in the *Technical Requirements* (N.J.A.C. 7:26E-1.4), the Army submitted a request to the NJDEP Site Remediation Program dated June 17, 2010 to conduct an alternative Public Notification Plan. This request was approved by the NJDEP in correspondence dated June 24, 2010, a copy of which is provided in Appendix M.

The alternative Public Notification Plan includes newspaper advertisements being placed in local and county newspapers through the Asbury Park Press and Link, all public notification documents being sent to the Municipal Clerk for each municipality in which the contaminated site is located, and to the local designated health officials. FTMM has also established a local document repository for all reports produced regarding the site remediation areas of concern (AOCs) at Fort Monmouth. The repository is located at the Monmouth County Library in Shrewsbury, New Jersey, where all reports are available for public review. Said reports are also available online at https:/cecom100.monmouth.army.mil/usagfmima/sites/local/brac.asp.

The Fort conducted two Open Houses in January of 2008 and January of 2009, during which time figures and data regarding all of the Fort's site remediation AOCs were on display; environmental personnel from the Fort were available to answer questions from the public. The Fort will conduct a third Open House should the need arise.

The Fort also operates a Fort Restoration Advisory Board (RAB) which holds quarterly public meetings held by RAB members who are public citizens, not elected officials, selected from all of the surrounding towns. They review and comment on technical documents and plans relative to ongoing environmental investigations and restoration activities at the Fort. Members serve as liaisons with the community and are available to meet with community members and groups. The meetings are open to the public and notification of all meetings is provided in local newspapers as well as by mail to all interested parties. All environmental projects subject to the *Technical Requirements* are presented to the RAB via this public forum. Examples of the

newspaper advertisement and Affidavit of Publication placed in the Asbury Park Press are provided in Appendix M.

8.0 REMEDIAL ACTION PROGRESS

Long-term ground water monitoring results indicate that PCE concentrations have decreased in monitoring wells where concentrations were greater than NJDEP GWQS at the onset of the first HRC® injection. Concentrations of PCE have continued to decrease in certain monitoring wells, notably M-5MW11 and M-5MW16, through the current reporting period (1st Quarter 2009 through the 3rd Quarter 2010). Concentrations of PCE in other monitoring wells, notably M-5MW19 and M-5MW20, appeared to stabilize. Concentrations of PCE degradation byproducts appear to have stabilized, but continue to increase in some wells.

Concentrations of PCE and breakdown byproducts (TCE and vinyl chloride) continued to exceed NJDEP GWQS in monitoring wells M-8MW23, M-8MW12, M-5MW11, M-5MW16, M-5MW20, M-5MW19 and M-5MW23. The greatest concentrations of PCE remain in hydraulically upgradient monitoring well M-5MW16. At the time of report preparation, additional rounds of chemical injections have been planned. The effectiveness of these injections will be covered in subsequent RAPRs.

8.1 Costs of Remediation Incurred to Date

Total costs to date for the annual implementation of the RAs performed at the M-5 Landfill are approximately $1,961K (Appendix N). This includes the Preliminary Assessment (PA) Phase, SI, RI, Remedial Design, RA, LTM, and reporting.

8.2 Ground Water Conclusions

Figures 5-2 through Figure 5-6 illustrate the trends in concentrations of PCE and degradation byproducts with time for monitoring wells M-5MW11, M-5MW16, M-5MW19, M-5MW20 and M-5MW23 where these chlorinated VOCs were detected greater than their respective NJDEP GWQS. During this reporting period, PCE and/or degradation byproducts were not detected in four of the 13 monitoring wells (M-5MW10, M-5MW12, M-5MW13 and M-5MW14).

PCE was detected at concentrations greater than NJDEP GWQS in M-5MW11. PCE concentrations in M-5MW11 ranged from 0.69 (1st Quarter 2010) to 2.74 µg/L (2nd Quarter 2009). PCE concentrations exceeded NJDEP GWQS in five of seven sampling rounds during the current reporting period.

PCE was detected at concentrations greater than NJDEP GWQS in M-5MW16. PCE concentrations in M-5MW16 ranged from 1.36 µg/L (1st Quarter 2010) to 4.9 µg/L (4th Quarter 2009). PCE concentrations exceeded the NJDEP GWQS in all seven sampling rounds during the current reporting period.

PCE was detected at concentrations greater than NJDEP GWQS in M-5MW19 [3.17 µg/L (2nd Quarter 2009) and 3.03 µg/L (1st Quarter 2009)]. PCE concentrations were either ND or

detected at less than NJDEP GWQS for the remaining five rounds of the current reporting period.

PCE was detected at concentrations greater than NJDEP GWQS in M-5MW20, ranging from 0.96 (4th Quarter 2009) to 11.13 µg/L (2nd Quarter 2010). PCE was detected at concentrations less than NJDEP GWQS in M-5MW20 in the 4th Quarter 2009 and greater than NJDEP GWQS in all other sampling events during this reporting period.

PCE was detected at concentrations greater than NJDEP GWQS in M-5MW23, ranging from 1.76 µg/L (4th Quarter 2009) to 46.64 µg/L (3rd Quarter 2010). PCE concentrations exceeded NJDEP GWQS for all seven sampling rounds during the current reporting period.

TCE was detected at concentrations greater than NJDEP GWQS in M-5MW16, ranging from ND (3rd and 4th Quarters of 2009) to 1.84 µg/L (1st Quarter 2010). The NJDEP GWQS for TCE is 1 µg/L. TCE was detected at concentrations less than NJDEP GWQS in M-5MW16 in four of the sampling events conducted during this reporting period (2nd, 3rd, and 4th Quarters of 2009 and 3rd Quarter 2010).

TCE was detected at concentrations greater than NJDEP GWQS in M-5MW19, ranging from ND (3rd Quarter 2009 and 3rd Quarter 2010) to 2.9 µg/L (1st Quarter 2009). TCE was detected at concentrations in compliance with the NJDEP GWQS in M-5MW19 in the 2nd and 4th Quarters of 2009 and 1st and 2nd Quarters of 2010, and was ND in the 3rd Quarters of 2009 and 2010.

TCE was detected at concentrations greater than NJDEP GWQS in M-5MW20, ranging from 0.30J (4th Quarter 2009) to 51.25 µg/L (2nd Quarter 2010). TCE was detected at concentrations less than NJDEP GWQS for the 2nd and 4th Quarters of 2009, but detected at concentrations greater than NJDEP GWQS for the remaining five rounds of sampling in the current reporting period.

TCE was detected at concentrations greater than NJDEP GWQS in M-5MW23 at 1.77 µg/L, 2.15 µg/L, and 2.62 µg/L during the 1st, 2nd and 3rd Quarters of 2010, respectively. TCE was not detected throughout the remaining sampling events during the current reporting period (1st, 2nd, 3rd and 4th Quarters of 2009).

cis-1,2-DCE concentrations in M-5MW20 ranged from 1.44 (4th Quarter 2009) to 111.95 µg/L (2nd Quarter 2010); *cis*-1,2-DCE concentrations exceeded the NJDEP GWQS of 70 µg/L in one of seven sampling rounds for the current reporting period and were either ND or detected below NJDEP GWQS in the remaining nine monitoring wells associated with the M-5 Landfill.

Vinyl chloride was detected at concentrations greater than NJDEP GWQS in M-5MW16, ranging from 1.15 (2nd Quarter 2010) to 1.28J µg/L (1st Quarter 2009). Vinyl chloride was ND in M-5MW16 in the remaining rounds of sampling for the current reporting period. Vinyl

chloride was not detected in the other nine monitoring wells associated with the M-5 Landfill throughout the current reporting period.

Ground Water Discussion

Ground water monitoring conducted during the current reporting period identified PCE, TCE, and vinyl chloride at concentrations that exceeded the NJDEP's GWQS for Class II-A aquifers. PCE was detected at concentrations greater than the NJDEP GWQS of 1 µg/L in five monitoring wells (M-5MW11, M-5MW16, M-5MW19, M-5MW20, and M-5MW23). TCE was detected at concentrations greater than the NJDEP GWQS of 1 µg/L in four monitoring wells (M-5MW16, M-5MW19, M-5MW20, and M-5MW23). *cis*-1,2-DCE was detected at concentrations exceeding the NJDEP GWQS of 70 µg/L in monitoring wells M-5MW16 and M-5MW20. Vinyl chloride was detected at concentrations greater than the NJDEP GWQS of 1 µg/L in monitoring well M-5MW16 only.

In addition, two metals (arsenic and antimony) were detected at concentrations exceeding NJDEP GWQS. As detailed in Section 6.0 of this RAPR, these metal detections are the direct result of acid leaching of suspended solids in ground water samples. Therefore, metals are not considered COCs at the M-5 Landfill. In addition, due to the extremely slow migration rates of metals in ground water, they pose little potential for migration.

8.3 Surface Water Conclusions

During this reporting period, surface water samples were collected from a total of 15 locations used to monitor the Main Post Area. All locations were monitored for VOCs, with select locations monitored for arsenic and lead or the full suite of TAL metals.

During the current reporting period, surface water samples were collected from three locations along Mill Creek and Laferta Creek: SS-24 (upstream of M-5 Landfill), SS-5 (along the western boundary of M-5 Landfill), and SS-28 (downstream of M-5 Landfill). PCE concentrations exceeded NJDEP Surface Water Quality Standards (SWQS) in SS-5, SS-24, and SS-28. TCE concentrations exceeded NJDEP SWQS in SS-24. Although PCE and TCE were detected at concentrations exceeding NJDEP SWQS, the location and distribution of COCs suggests that the M-5 Landfill is not the probable source for these VOCs.

8.4 Future Plans

The following actions are planned:

- Prepare a Remedial Action Selection Report (RASR)/Feasibility Study (FS) that will include a final closure plan for the M-5 Landfill.

- Continue quarterly ground water and surface water sampling until closure of Fort Monmouth in September 2011. At that time, future sampling will be evaluated and discussed with NJDEP.

- Discontinue analysis of ground water samples for metals.

8.5 Remedial Action (RA) Schedule

The table and Gantt chart provided in Appendix N represent a scheduled summary for remedial activities at the M-5 Landfill from the PA phase through the end of this reporting period and estimated into the future. Said table and chart include actual costs and schedule to date and estimated/anticipated costs and projected schedule for future activities.

9.0 CLASSIFICATION EXCEPTION AREA (CEA)

Brinkerhoff Environmental Services, Inc. (Brinkerhoff) completed a proposed CEA in accordance with current NJDEP guidelines, specifically the procedures described in the *Final Guidance on Designation of CEAs* and the *Technical Requirements for Site Remediation* (*Technical Requirements*), New Jersey Administrative Code (N.J.A.C.) 7:26E-8.4, last amended on November 4, 2009.

A combined M5/M8 CEA was generated based on the COCs present at both landfills. The CEA is based upon current ground water conditions and the prediction of future ground water conditions. Therefore, only the most recent analytical data set from the September 2010 sampling event was used to estimate the extent of the CEA. Data from the most recent sampling rounds (2009 and 2010) indicate that eleven constituents: three volatile organic compounds (VOCs), six pesticides, and two metals, exceeded NJDEP GWQS.

Arsenic and antimony were detected in ground water samples collected during the September 2010 sampling event at concentrations exceeding NJDEP GWQS. Metals are known to migrate slowly and to not degrade. Metals in ground water throughout Fort Monmouth were evaluated using statistical analyses and published literature information (Brinkerhoff, 2011 *Background Metals Evaluation*). It was concluded that the metals detections in ground water are likely a combination of a natural dissolved component along with input from sample turbidity and thus are not included in the CEA.

Pesticides are also not included in the CEA as pesticide concentrations detected in shallow groundwater are indicative of proper pesticide application in a residential setting and do not represent a release/spill of pesticides. Input from sample turbidity, as seen base-wide with metals concentrations in ground water, is seen as a contributing factor to the pesticide detections historically observed in M-5/M-8 Landfill ground water. Therefore, VOCs (PCE, TCE, and VC) are the only compounds on which the fate and transport modeling included in this report are based. Fate and transport modeling results for PCE are presented for the well with the highest detected concentrations, along with historical measured data. The decreasing 2000 to 2010 modeled results show the fate and transport model calibration, and from 2010 to the year when the concentration in the “hot spot” decreases to comply with NJDEP GWQS.

The CEA duration for PCE is 20 years (September 2010 to September 2030). The CEA duration for pesticides is indeterminate. The September 2010 CEA extent is approximately three acres.

The vertical extent of the Site CEA includes the shallow part of the aquifer beneath the Site and it extends from the water table, five feet below ground surface (bgs) to approximately 20 feet bgs, which represents the total depth of the wells at both landfills.

Re: M-5 Landfill Site (FTMM-05) Remedial Action Progress Report
October 2006 through December 2008 (4th Quarter 2006 – 4th Quarter 2008)
Dated: September 2010
Fort Monmouth, New Jersey

Dear Mr. Quinn:

U.S. Army Fort Monmouth, New Jersey is pleased to submit the *Remedial Action Progress Report* (RAPR) for the M-5 Landfill Site (FTMM-05), Fort Monmouth, New Jersey. This RAPR was prepared in accordance with the voluntary cleanup agreement between U.S. Army and the New Jersey Department of Environmental Protection (NJDEP) dated August 2000, and the NJDEP's *Technical Requirements for Site Remediation*, New Jersey Administrative Code 7:26E-6.5 (February 2002). Enclosed please find the Electronic Data Delivery (EDD) documents and the completed RAPR Checklist.

Should you have any questions or require any additional information, please contact Mr. Charles Appleby, Environmental Protection Specialist, at 732-532-2692 or email: **Charles.Appleby@US.Army.mil**

Sincerely,

Joseph M. Fallon

Joseph M. Fallon, CHMM
Chief, Environmental Division

SRP CHECKLIST:		REMEDIAL ACTION PROGRESS REPORT 4th Quarter 2006 through 4th Quarter 2008 M-5 Landfill Site (FTMM-05)		
	N.J.A.C. 7:26E-	Use this checklist to assure that the remedial action progress report is complete and meets all technical requirements.	Included: Yes/No/NA	Page #
	6.6(a)	Have progress reports been submitted as required?	NA	
	6.6(b)1	Is a description of each remedial action included and adequate?	Yes	3-1
	6.6(b)2	Is a discussion of problems and proposal for correction included and adequate?	NA	
	6.6(b)3	Are proposals for deviation from approved WP adequately addressed?	NA	
		6.3(e)3iii If requesting to reduce sampling frequency have the requirements at 6.3(e)3iii and in Appendix C been met?	NA	
	6.6(b)4	Is a revised schedule included and adequate?	Yes	6-4 & App.H
	6.6(b)5	Is the status of permit applications included and adequate?	Yes	3-1
	6.6(b)6	Is a list of upcoming remedial actions included and adequate?	Yes	6-4 & App.H
	6.6(b)7	Is the cost of each remedial action adequately documented?	Yes	6-1 & App.H
	6.6(b)8	Is a table of sampling results, summary of data and conclusions included and adequate?	Yes	6-1 & Tables Section
	6.6(b)9	Is information for active GW remediation included and adequate?	NA	
		6.6(b)9i Has a ground water Contour Map Reporting Form (Appendix G) been completed and included?	Yes	Figures Section
	6.6(b)10	Is information for natural GW remediation included and adequate?	Yes	4-1 & 5-1
	6.6(b)11	Is a description of wastes generated included and adequate?	Yes	4-2
	6.6(b)12	Has other important information been included:	NA	
		If not previously provided, has a map of the CEA been included along with a CEA Factsheet from Appendix F?	NA	
		If the RAPR includes a proposal to revise the CEA, has all the necessary information per 6.3 and Appendix F been included?	NA	
		Does the report indicate whether biennial certifications have been submitted for CEAs &/or DERs?	NA

THIS PAGE INTENTIONALLY LEFT BLANK

EXECUTIVE SUMMARY

This Remedial Action Progress Report (RAPR) documents the quarterly sampling of 13 monitoring wells [10 located at the M-5 Landfill Site (FTMM-05) and three located at the adjacent M-8 Landfill Site (FTMM-08)] from the 4th Quarter 2006 through the 4th Quarter 2008 (Rounds 39 through 47) to monitor the progress of the enhanced natural attenuation program [Hydrogen Release Compound® (HRC®)] in reducing contaminant levels in ground water.

The M-5 Landfill Site consists of approximately 3.2 acres located on the western portion of the Main Post, on the Eatontown/Oceanport Borough line. The site is bordered by Mill Creek and Parkers Creek to the west and is adjacent to the southern boundary of the M-8 Landfill Site.

A *Remedial Action Work Plan (RAWP)* was submitted by ATC Associates, Inc. (ATC) in February 2000 and approved by the New Jersey Department of Environmental Protection (NJDEP) in March 2001. The *RAWP* proposed enhanced natural attenuation with ground water monitoring as the site remedy for the Contaminant of Concern (COC), tetrachloroethene (PCE). PCE, trichloroethene (TCE), *cis*-1,2-dichloroethene (*cis*-1,2-DCE), and vinyl chloride, have been identified as COCs in follow-up *RAPRs* submitted to the NJDEP.

Ground water monitoring of the site during the current reporting period identified concentrations of PCE, TCE, and vinyl chloride above the NJDEP Ground Water Quality Standards (GWQS) for Class II-A aquifers. PCE was detected above the GWQS of 1.0 microgram per liter (µg/L) in six monitoring wells (M-5MW11, M-5MW16, M-5MW19, M-5MW20, M-5MW23, and M-8MW12). TCE was detected above the GWQS of 1.0 µg/L in four monitoring wells (M-5MW16, M-5MW19, M-5MW20, and M-8MW12). *cis*-1,2-DCE was either not detected or detected below the NJDEP GWQS in the monitoring wells associated with M-5 Landfill Site and the three monitoring wells associated with the M-8 Landfill Site. Vinyl chloride was detected above the GWQS of 1.0 µg/L in two monitoring wells (M-5MW16 and M-8MW23).

During this reporting period, surface water samples were collected from three surface water locations used to monitor the M-5 Landfill Site and analyzed for Volatile Organic Compounds (VOCs). PCE and TCE were detected at one location, SS-15, exceeding freshwater Surface Water Quality Standards (SWQS).

PCE concentrations have decreased in monitoring wells where concentrations were above the GWQS prior to the first HRC® injection. VEETech, PC (VEETech) recommends that the Directorate of Public Works (DPW) continue quarterly ground water and surface water monitoring and consider additional biological or chemical oxidation treatment events.

THIS PAGE INTENTIONALLY LEFT BLANK

1.0 INTRODUCTION

An enhanced natural attenuation program to remediate the PCE at the M-5 Landfill Site (FTMM-05), located at the Main Post Area of Fort Monmouth, New Jersey, is being conducted in accordance with the *RAWP*, prepared by ATC, Inc. in February 2000 and approved by the NJDEP in March 2001.

The U.S. Army Garrison Fort Monmouth, Directorate of Public Works (DPW), and Chenega Technology Services Corporation issued the contract under Chenega purchase order number C06-02456 to VEETech to prepare this RAPR. This RAPR documents ground water (Rounds 39 through 47) and surface water (Surface Water Rounds 41 through 49) monitoring during the current reporting period of the 4th Quarter 2006 through the 4th Quarter 2008.

1.1 Objectives

The objective of this RAPR is to document the implementation of the remedial action program performed at the M-5 Landfill Site during the current reporting period of the 4th Quarter 2006 through the 4th Quarter 2008. HRC® injections were implemented from October 2000 to December 2005 by the DPW as a Remedial Action (RA) based on the recommendations found in the *RAWP*, prepared by ATC, dated February 2000, and approved by the NJDEP in March 2001. The purpose of the RA was to treat the contaminant-affected areas at the site using HRC® to reduce the contaminant concentrations to comply with the NJDEP Class II-A aquifer GWQS. The remedial activities were conducted in accordance with the NJDEP *Technical Requirements for Site Remediation* (2005), NJAC 7:26E *et seq.* and the M-5 Landfill Site *RAWP*.

The RA and subsequent preparation of this RAPR encompassed the following:

- Conducting quarterly rounds of ground water and surface water sampling and documenting the results to evaluate the effectiveness of the RA,
- Comparing the results of the ground water and surface water sampling with the NJDEP GWQS and SWQS,
- Identifying and discussing recommendations with the DPW for the continuation of this RA, and
- Documenting remedial activities as required by the NJDEP *Technical Requirements for Site Remediation* NJAC 7:26E *et seq*.

1.2 Report Organization

Section 2.0 discusses the site history and background information for the M-5 Landfill Site. Section 3.0 describes and summarizes the remedial activities at the M-5 Landfill Site. Section 4.0 discusses ground water and surface water monitoring and sampling activities at the site. Section 5.0 presents the analytical results of the ground water and surface water sampling. Section 6.0 discusses the effectiveness of the RA and provides recommendations to the DPW for the M-5 Landfill Site. Section 7.0 is the reference section.

THIS PAGE INTENTIONALLY LEFT BLANK

2.0 SITE BACKGROUND

The following sections describe the site background of the M-5 Landfill Site. Included is a description of the site location, site history, background investigations, and previous *RAPRs*.

2.1 Site Location and Description

Fort Monmouth is located in the central-eastern portion of New Jersey in Monmouth County, approximately 45 miles south of New York City and 70 miles northeast of Philadelphia (Figure 2-1). The M-5 Landfill Site is located on the western portion of the Main Post, on the Eatontown/Oceanport Borough line and east of Mill Creek and Parkers Creek, and consists of approximately 3.2 acres (Figure 2-2). The M-5 Landfill Site is adjacent to the southern boundary of the M-8 Landfill Site. According to a report prepared by the U.S. Army Toxic and Hazardous Materials Agency (USATHAMA) titled, *Installation Assessment of Fort Monmouth, Report 171*, dated May 1980, the M-5 Landfill was in use between 1952 and 1959 for general disposal of domestic and industrial wastes, in addition to automobiles. This site has reportedly been inactive since 1959. Since 1959, there has been a steady growth and stabilization of vegetation (grass, trees, and bushes) on the site. The environmental setting (regional/local geology and hydrogeology) of the M-5 Landfill Site is described in ATC's *RAWP*.

2.2 Site History and Background Investigations

The U.S. Army Corps of Engineers (USACE), Baltimore District, initially contracted Roy F. Weston, Inc. (Weston) to perform a Site Investigation (SI) at Fort Monmouth, New Jersey. Suspected hazardous waste sites were initially identified at Fort Monmouth in a report prepared by USATHAMA (1980). The USATHAMA report identified 37 sites with known or suspected waste materials on the Main Post and a sub-post (Charles Wood Area). Weston conducted a background investigation of the 37 sites, as well as eight additional sites that were identified by Fort Monmouth and the NJDEP. Weston's findings were described in a report titled *Investigation of Suspected Hazardous Waste Sites at Fort Monmouth, New Jersey* (1993). The M-5 Landfill Site was one of the 37 sites identified.

In 1995, Weston conducted a SI of the M-5 Landfill Site and prepared a *SI Report* (December 1995). The Weston *SI Report, Final Site Investigation, Fort Monmouth, New Jersey, Main Post and Charles Wood Areas* (Appendix A) was used as the basis for subsequent remedial investigations, which progressed to the development of remedial actions, including the remediation program at the M-5 Landfill Site. From May 1997 through September 1999, the DPW conducted a Remedial Investigation (RI) of the site. ATC was contracted by the DPW to evaluate the data collected during the RI and prepare the *RAWP*.

2.2.1 SI Report, 1995 – Weston

The Site Investigation (SI), performed by Weston in 1995 (Appendix A) at the M-5 Landfill Site included installation and sampling of two ground water monitoring wells [M-5MW10 (downgradient) and M-5MW11]. Surface water sampling was not performed for the M-5 Landfill Site, although surface water had previously been sampled in conjunction with the M-2 Landfill Site, which is upgradient. Two rounds of ground water sampling were performed and samples were analyzed for Target Compound List (TCL) plus 30 parameters (TCL+30), Target Analyte List (TAL) metals, sulfate, and cyanide.

A background study of the Main Post was conducted as part of the site investigation reported in 1995. Five soil borings on the Main Post were placed in areas believed to be unaffected by base activities, as specified by the 1993 *Investigation of Suspected Hazardous Waste Sites at Fort Monmouth, New Jersey Report.* Two soil samples were collected from each of the five soil borings. The soil borings were converted to monitoring wells and two ground water samples were collected from each well. Two sediment and surface water samples were also collected as part of the background study. Maximum background concentrations were then established and reported in the SI for soil, ground water, surface water, and sediment for the Main Post Area of Fort Monmouth so that they could be compared to the analytical results from the SI (Weston, 1995).

Ground water analytical data for one ground water monitoring well indicated that PCE concentrations exceeding the NJDEP GWQS of 1.0 µg/L were present at the M-5 Landfill Site in well M-5MW11. There were no detections of sulfate or cyanide above the NJDEP GWQS. Fourteen metals were detected in site ground water; however, only four (aluminum, iron, manganese, and sodium) were found at concentrations exceeding the NJDEP GWQS, but were detected at concentrations below the maximum background concentrations established in the *SI Report* (Weston, 1995), and were therefore not identified as COCs.

The Weston *SI Report* (1995) presented a proposal to the DPW for the M-5 Landfill Site that was subsequently implemented. A long-term ground water and surface water monitoring program was proposed that utilized the existing ground water monitoring wells and surface water sampling locations to monitor and document the downgradient surface water and ground water quality conditions over time.

An expanded SI, requested by the NJDEP, identified PCE as the only COC in ground water at the M-5 Landfill Site. The DPW installed three additional wells (M-5MW12, M-5MW13, and M-5MW14) in 1998 as part of the expanded SI. This resulted in the performance of a Remedial Investigation (RI) encompassing soil and ground water characterization to determine the extent of the impacts of PCE at the site.

2.2.2 RAWP, 2000 – ATC

ATC submitted a *RAWP* to Fort Monmouth in February 2000 (Appendix B). From April 1995 through September 1999, the DPW performed a RI of the M-5 Landfill Site. ATC was contracted by the DPW to install additional ground water monitoring wells, evaluate the data collected during the RI, and prepare a *RAWP*.

The following RI approach was established:

- Perform a Geoprobe® investigation of the soils and ground water within the landfill and surrounding areas to characterize the near-surface and subsurface soils and shallow ground water and determine whether a source area existed for the PCE observed in the ground water.
- Install additional ground water monitoring wells within the landfill and surrounding areas and perform constant discharge pump tests to determine the aquifer characteristics of the shallow saturated zone beneath the M-5 Landfill Site.
- Incorporate the new wells into the quarterly ground water monitoring program.

- Continue quarterly surface water sampling to evaluate the potential impact to the stream from the PCE detected in the soils and shallow ground water.

Geoprobe® Investigation

The RI involved the drilling of 261 Geoprobe® locations to facilitate the collection of soil and ground water samples. The results of the RI indicated that PCE was detected at concentrations above the Method Detection Limit (MDL) in seven of the soil borings and at concentrations that exceeded the NJDEP Impact to Ground Water Soil Cleanup Criteria (IGWSCC) of 1.0 milligram per kilogram (mg/Kg) in five samples. PCE was detected in ground water samples collected from 105 boring locations at concentrations that exceeded the NJDEP GWQS for PCE of 1.0 µg/L.

Eight VOCs)PCE, TCE, *cis*-1,2-DCE, chlorobenzene, benzene, toluene, ethylbenzene, and total xylenes) were detected in ground water samples above their respective MDL. Of these, PCE, TCE, *cis*-1,2-DCE, chlorobenzene, and benzene were identified in ground water at concentrations that exceeded their respective GWQS. PCE concentrations above the GWQS were detected in 105 samples. TCE (6 samples), *cis*-1,2-DCE (10 samples), chlorobenzene (5 samples), and benzene (9 samples) were detected at concentrations above their respective GWQS.

Monitoring Wells

A total of 15 ground water monitoring wells, three (M-5MW10, M-5MW11, and M-8MW12) installed by Weston (1995), three (M-5MW12, M-5MW13, and M-5MW14) installed by the DPW (1998), and nine monitoring wells (M-5MW15, M-5MW16, M-5MW18, M-5MW19, M-5MW20, M-5MW23, M-5MW25, M-8MW23, and M-8MW24) installed by ATC (1999), have been incorporated into the ground water monitoring program at the M-5 Landfill Site. Monitoring well depths range from 14 to 20 feet below ground surface (bgs). Ground water analytical results from the permanent monitoring wells identified PCE as the only COC at the M-5 Landfill Site. Although PCE concentrations were expected to naturally attenuate to acceptable levels over time, the DPW proposed to actively remediate the affected areas at the M-5 Landfill Site by targeting seven specific locations and applying HRC®.

2.2.3 RAPR, 1999-2002 – Versar

After the first and second HRC® injection and twelve rounds of ground water monitoring well sampling (4th Quarter 1999 through the 3rd Quarter 2002), Versar prepared a *RAPR*, dated August 2003. The *RAPR* documented the ground water quality conditions over time and evaluated the impact of the HRC® injection program.

The initial injection of HRC® was performed between October and December 2000 and the second was performed between February and May 2002. These injection events were completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule agreement.

A decreasing trend in PCE concentrations and an increase in degradation byproduct concentrations in ground water were observed during the reporting period (4th Quarter 1999 through the 3rd Quarter 2002). Ground water analytical results supported the contention that COC degradation was occurring at the M-5 Landfill Site, presumably due to the effectiveness of the HRC® injection program that supported the biodegradation processes.

Based on the concentrations of the COC in ground water following the HRC® injections, the HRC® subsurface injection program was continued by the DPW.

2.2.4 RAPR, 2002-2003 – Versar

The third HRC® injection round was performed by the DPW between June and August 2003. This injection event was completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule agreement. Versar prepared a second *RAPR*, dated September 2005, following the third injection event for the reporting period 4th Quarter 2002 through the 3rd Quarter 2003. Said *RAPR* documented the ground water quality conditions over time and evaluated the effectiveness of the HRC® injection program.

A decreasing trend in PCE concentrations was observed in ground water at the site throughout the four quarters of ground water sampling. Ground water analytical results supported the contention that PCE degradation was occurring at the M-5 Landfill Site, presumably due to the effectiveness of the HRC® to support the biodegradation processes.

Based on the decreasing concentrations of the COC and the increased presence of degradation products in ground water during the reporting period, the HRC® subsurface injection program was continued.

2.2.5 Remedial Investigation Report and Sediment Quality Evaluation, 2004 – Versar

To determine potential polychlorinated biphenyl (PCB)-related impacts to sediments in Mill Creek from the adjacent M-5 Landfill site, the DPW obtained 16 sediment samples, including three duplicate samples for Quality Assurance/Quality Control (QA/QC) purposes, on April 13, 2000 from the surface and near-surface of Mill Creek. The sediment samples were obtained along the 570-foot section of the creek that borders the M-5 Landfill site. All 16 sediment samples were analyzed for PCBs and compared to sediment sampling guidance concentrations defined in the NJDEP *Guidance for Sediment Quality Evaluations* (November 1998). Only one of the 16 samples (0.054 mg/Kg, B-2 0-6" bgs) had total PCBs detected above the laboratory MDL. This sample result also exceeded the NJDEP Effect Range - Low (ER-L) guidance concentration for total PCBs, which represents the concentration at which adverse benthic effects are found in approximately 10% of studies. Other guidance criteria were not exceeded. Analysis of the remaining 15 samples, including upgradient samples, did not indicate PCBs above laboratory MDLs. Because the result at Boring B-2 exceeded only the ER-L guidance concentration, and the proximal upgradient samples were non-detect (ND) for Total PCBs, no long-term adverse benthic effects were expected in Mill Creek. The *Remedial Investigation Report and Sediment Quality Evaluation* dated January 26, 2004 is included in Appendix C.

2.2.6 Remedial Investigation Report for Near Surface Soils, 2004 – Versar

DPW characterized the near surface soils using 254 borings installed at strategic locations throughout the site. *The Remedial Investigation Report for Near Surface Soils* dated March 16, 2004 is included in Appendix D. The DPW performed soil borings and obtained soil samples between September 1998 and November 1998. Soil samples were analyzed for TCL+30 parameters and TAL metals.

VOCs, Semi-Volatile Organic Compounds (SVOCs), pesticides, PCBs, and metals were detected at concentrations exceeding the NJDEP Residential Direct Contact Soil Cleanup Standards (RDCSCS). Further analysis of the analytical results did not define a “source area” or level of

contamination that necessitated the identification and evaluation of additional remedial actions. In most cases, either the calculated compliance average was below the respective RDCSCS or the exceedance was considered marginal.

2.2.7 RAPR, 2003-2005 – VEETech

The fourth HRC® injection round was performed by the DPW between June and August 2004. This injection event was completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule agreement. VEETech prepared another *RAPR*, dated March 2009, for the reporting period 4th Quarter 2003 through the 3rd Quarter 2005. Said *RAPR* documented the ground water quality conditions with time and evaluated the effectiveness of the HRC® injection program.

A decreasing trend in PCE concentrations was observed in ground water at the site throughout the eight quarters of ground water sampling. Ground water analytical results supported the contention that PCE degradation was occurring at the M-5 Landfill Site, presumably due to the effectiveness of the HRC® to support the biodegradation processes.

Based on the decreasing concentrations of the COC and increased presence of degradation products in ground water during the reporting period, the HRC® subsurface injection program was continued.

2.2.8 RAPR, 2005-2006 – VEETech

The fifth HRC® injection event was performed by the DPW between September and December 2005. This injection event was completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule agreement. VEETech prepared another *RAPR*, dated April 2009, for the reporting period 4th Quarter 2005 through the 3rd Quarter 2006. Said *RAPR* documented the ground water quality conditions with time and evaluated the effectiveness of the HRC® injection program.

A generally decreasing trend of PCE concentrations was observed in ground water at the site throughout the four quarters of ground water sampling. The results supported the contention that PCE degradation was occurring at the M-5 Landfill Site, presumably due to the effectiveness of the HRC® supporting the biodegradation processes.

THIS PAGE INTENTIONALLY LEFT BLANK

3.0 REMEDIAL ACTIVITIES

Sampling results documented in ATC's *RAWP* (February 2000) for the M-5 Landfill Site indicated that the shallow ground water contained PCE at concentrations that exceeded the NJDEP GWQS. Although the PCE concentrations in ground water were expected to gradually decrease through natural attenuation, the DPW implemented an HRC® injection program from October 2000 to December 2005 to actively address the ground water contamination at the site. This bioremediation program involved treating seven areas identified in the *RAWP* where elevated concentrations of PCE were detected (Figure 3-1).

3.1 Hydrogen Release Compound®

HRC® is a slow-release compound that provides a steady hydrogen source for up to one year and has proven to enhance the natural attenuation of chlorinated dissolved solvents in ground water at different study sites. HRC® is a proprietary, food quality, polylactate ester that, upon being deposited into the subsurface, creates or enhances anaerobic aquifer conditions and causes the release of hydrogen. Under anaerobic conditions, naturally occurring microorganisms use the hydrogen to progressively remove chlorine atoms from chlorinated hydrocarbons via reductive dechlorination.

HRC® applications were conducted in accordance with the M-5 Landfill Site *RAWP*. Varying numbers of boring locations within each of the seven delineated areas (from 6 to 59) were selected for HRC® injections. Figure 3-1 illustrates the seven treatment areas.

HRC® injection was not conducted during the current reporting period of the 4th Quarter 2006 through the 4th Quarter 2008.

3.2 Discharge to Ground Water Permit

The purpose of the New Jersey Pollutant Discharge Elimination System (NJPDES) Discharge to Ground Water (DGW) Permit is to request a formal approval of the HRC® subsurface injection program at the M-5 Landfill Site as described in the *RAWP*. The fifth injection of HRC® was completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule agreement. As described in the *RAWP*, the HRC® injections do not result in the discharge of hazardous compounds.

THIS PAGE INTENTIONALLY LEFT BLANK

4.0 MONITORING AND SAMPLING ACTIVITIES

As part of the Long Term Monitoring (LTM) program at the M-5 Landfill Site, quarterly ground water monitoring (Rounds 39 through 47) and surface water sampling (Rounds 41 through 49) continued from the 4th Quarter 2006 through the 4th Quarter 2008. Ground water samples were collected from 10 monitoring wells (M-5MW10, M-5MW11, M-5MW12, M-5MW13, M-5MW14, M-5MW16, M-5MW18, M-5MW19, M-5MW20, and M-5MW23) at the M-5 Landfill Site and three monitoring wells (M-8MW12, M-8MW23, and M-8MW24) at the northern adjacent M-8 Landfill Site during nine quarterly sampling events. Two monitoring wells, M-5MW15 and M-5MW25, were last sampled on July 30, 2003. Surface water samples were collected from three locations (SS-05, SS-15, and SS-27) along Mill and Parkers Creeks from the 4th Quarter 2006 through the 4th Quarter 2008. Sampling at SS-04 and SS-16 was discontinued after the 3rd Quarter 2004 (Round 32).

Sampling was conducted by the DPW in accordance with the established protocols as described in the *Fort Monmouth Standard Sampling Operating Procedure* (SOP No.: SAM-0205, August 1999, Revision #1 January 2003, Revision #2 September 2004, Revision #3 January 2006, and Revision #4 April 2008, Appendix E) and the *NJDEP Field Sampling Procedures Manual (*August 2005). Both ground water and surface water samples were analyzed for VOCs + 15. Surface water samples collected at SS-15 and SS-27 were also analyzed for TAL metals. Laboratory analyses of the samples were conducted at the Fort Monmouth Environmental Testing Laboratory (FMETL), a New Jersey-certified laboratory (Certification No. 13461).

4.1 Ground Water Monitoring

During the current ground water sampling program at the M-5 Landfill Site, ground water was encountered at elevations ranging from 1.86 to 13.14 feet above mean sea level (msl). Static depth to water measurements were collected from monitoring wells on November 16 & 17, 2006; March 7 & 8, 2007; June 6, 7, & 8, 2007; August 14, 2007; December 5, 2007; March 11, 2008; June 3, 2008; August 25, 2008; and November 10, 2008. Depths were reported for monitoring well M-5MW15 for only two quarterly sampling events (4th Quarter 2006 and the 2nd Quarter 2007). Depths were reported for monitoring well M-5MW25 for only four quarterly sampling events (4th Quarter 2006, 2nd Quarter 2007, 4th Quarter 2007, and 4th Quarter 2008). Separate-phase product was not observed in any of the monitoring wells during this reporting period. Figure 2-2 shows the locations of the monitoring wells. Depth to water measurement results are summarized in Table 4-1. Ground water elevation contour maps were generated based on ground water elevations calculated for the wells. Ground water elevation contour maps were not constructed for the 4th Quarter 2006 (Round 39) through the 2nd Quarter 2007 (Round 41), as the depth to ground water for these sampling events were measured on two or three separate days. Contour maps are presented in Figure 4-1 through Figure 4-9 along with the required NJDEP contour map reporting forms.

The contour maps indicate that shallow ground water underlying the M-5 Landfill Site consistently flows to the west towards Mill Creek and Parkers Creek. Significant variations in ground water flow conditions were not observed through the current monitoring period.

4.2 Ground Water Sampling

Quarterly ground water sampling was conducted by the DPW. Quality control samples for the monitoring period included 12 method blanks, 11 trip blanks, 11 field blanks, and 10 duplicate samples.

Sampling equipment was thoroughly decontaminated before and after each use. Following collection, the ground water samples were immediately placed in laboratory supplied bottleware. Sample containers were labeled, sealed, packed in ice, and transported to the FMETL under proper chain-of-custody procedures.

Copies of the chain-of-custody forms and the laboratory analytical data sheets are presented in Appendix F. Table 4-2 presents a summary of the ground water sampling activities for the remediation monitoring (Rounds 1 through 47); including round numbers, well IDs, sample IDs, sample locations, collection/analysis dates, analytical parameters, and analysis methods. Figure 2-2 shows the locations of the monitoring wells. The analytical results are discussed in Section 5.1.

4.3 Surface Water Sampling

Surface water sampling was conducted by the DPW for the current reporting period as part of a base wide surface water sampling program. A total of 29 surface water samples were collected over nine rounds of sampling from three locations (SS-05, SS-15, and SS-27) along Mill and Parkers Creeks. Sampling from SS-04 and SS-16 was discontinued after the 3rd Quarter 2004. Figure 2-3 shows the locations of surface water sample collection points. SS-05 is located adjacent to the site, SS-15 is located upstream, and SS-27 is located downstream of the M-5 Landfill Site. The samples were analyzed by the FMETL for VOCs. The results of these analyses are discussed in Section 5.2.

Sampling equipment was decontaminated before and after each use. Surface water samples were collected and immediately placed in laboratory supplied bottleware. Sample containers were labeled, sealed, packed in ice, and transported to the FMETL under proper chain-of-custody procedures.

Copies of the chain-of-custody forms and the laboratory analytical data for surface water analyses are presented in Appendix G. Table 4-3 presents a summary of surface water sampling activities for Rounds 1 through 49 for sampling points SS-04, SS-05, SS-15, SS-16, and SS-27; including sampling rounds, sample IDs, stream sampling locations, collection/analysis dates, analytical parameters, and analysis methods. Sampling locations SS-04 and SS-16 were last sampled in August 2004.

4.4 Types of Waste Generated and Disposal Methods

The waste types generated by the sampling activities included polyethylene tubing, Teflon® bailers, mason string, and personal protective equipment (PPE). The tubing, bailers, string, and PPE were disposed of as non-hazardous waste.

5.0 SAMPLING ANALYTICAL RESULTS

This section includes a summary discussion of the chemical characterization of the site based on the samples collected and analyzed for the current reporting period, including nine quarterly rounds of ground water monitoring well samples and nine rounds of surface water samples. Analytes detected in ground water or surface water samples at concentrations above their respective NJDEP GWQS are bolded and highlighted in the tables.

5.1 Ground Water Sampling Results

Summaries of the analytical results from the monitoring wells at the M-5 Landfill Site and three monitoring wells at the M-8 Landfill Site from inception of LTM are summarized in Tables 5-1 through Table 5-15. Monitoring wells M-5MW15 and M-5MW25 were last sampled in July 2003. Ground water summary tables include detected analytical results for the M-5 Landfill Site and are divided by monitoring well number and sampling date. The characterization of ground water quality at the M-5 Landfill Site contains 47 quarterly ground water sampling events conducted from May 1997 through November 2008. The ground water results are compared to the NJDEP GWQS and are presented in three different tabs (electronically) reflecting changes to the NJDEP criteria. The first set of data is compared against the January 7, 1993 criteria; the next is when a criteria change occurred on November 7, 2005; followed by another criteria change on July 27, 2007.

The results in the ground water summary tables include analyte detections as well as exceedances of the NJDEP GWQS, which are bolded and shaded. VOCs, SVOCs, pesticides/PCBs, and metals are presented as required to summarize results for detected compounds. Detections are presented in the ground water sampling result summary tables as follows:

- Xylenes are reported as total xylenes (the sum of *o*-xylene and *m*,*p*-xylenes).
- Tentatively Identified Compounds (TICs) are added and reported as a total concentration for the sum of TICs detected for VOCs and SVOCs.
- Duplicate samples are included after the respective primary sample.
- Low Flow sampling method results are identified as “LF”.
- A “J” value is a concentration exceeding the MDL but less than the Reporting Limit (RL) for VOCs, SVOCs, and pesticides/PCBs.
- Estimated Results “ER” are concentrations exceeding the MDL and less than the RL for metals.
- A “B” value is a compound detected in the sample and the associated blank sample.

- Sample suites that were discontinued are recorded in the footnotes along with a date of NJDEP case manager approval.
- If a particular sample suite or analyte was not detected in a monitoring well, the suite/analyte is not presented in the monitoring well summary table.

Ten monitoring wells (M-5MW10 through M-5MW14, M-5MW16, M-5MW18 through M-5MW20, and M-5MW23) at the M-5 Landfill Site and three monitoring wells (M-8MW12, M-8MW23, and M-8MW24) at the northern adjacent M-8 Landfill Site were sampled during the current reporting period (4th Quarter 2006 through the 4th Quarter 2008) and analyzed for VOCs. Analysis for SVOCs, pesticides/PCBs, and metals was discontinued for monitoring wells at the M-5 Landfill Site starting with Round 26. Analysis for SVOCs, pesticides/PCBs, and metals was discontinued for monitoring wells at the M-8 Landfill Site starting with Round 28.

During nine quarterly sampling events for the current reporting period from November 2006 through November 2008, eleven VOCs were detected in the ten M-5 and three M-8 ground water wells. Three VOCs (PCE, TCE, and vinyl chloride) were detected at concentrations that exceeded their respective GWQS. Eight VOCs (1,3-Dichlorobenzene (DCB), 1,4-DCB, *cis*-1,2-DCE, acetone, benzene, chlorobenzene, methylene chloride, and toluene) were detected below their respective GWQS. Six VOCs (benzene, chlorobenzene, methylene chloride, toluene, 1,3-DCB and 1,4-DCB) were identified only in the M-8 wells. Benzene and chlorobenzene are COCs at the M-8 Landfill Site.

Analytical results for six monitoring wells (M-5MW11, M-5MW16, M-5MW19, M-5MW20, M-5MW23, and M-8MW12) sampled during the current reporting period exceeded the NJDEP GWQS for PCE. Analytical results for four monitoring wells (M-5MW16, M-5MW19, M-5MW20, and M-8MW12) sampled during the current reporting period exceeded the NJDEP GWQS for TCE. The concentration of vinyl chloride exceeded the NJDEP GWQS in two monitoring wells (M-5MW16 and M-8MW23). PCE was initially identified as the COC in the *RAWP*. PCE degradation byproducts, TCE, *cis*-1,2-DCE, and vinyl chloride have been identified as COCs in follow-up RAPRs submitted to NJDEP.

A summary of results exceeding GWQS in the current reporting period is presented in Table 5-16. Figure 5-1A summarizes the analytical results for COCs on a site map.

5.1.1 Ground Water Contaminants of Concern

The following paragraphs summarize the results of the COCs detected above the GWQS during the current reporting period:

- PCE concentrations in M-5MW11 ranged from ND to 5.24 µg/L (Round 42). PCE concentrations exceeded the GWQS of 1.0 µg/L in seven of nine sampling rounds for the current reporting period. Figure 5-2 illustrates the PCE concentration over time in monitoring well M-5MW11, including all quarters of LTM since May 1997.
- PCE concentrations in M-5MW16 ranged from 4.42 µg/L (Round 45) to 86.18 µg/L (Round 39). PCE concentrations exceeded the GWQS of 1.0 µg/L in all nine sampling rounds for the current reporting period. Figure 5-3A illustrates the PCE concentration over time throughout the LTM in monitoring well M-5MW16.

- TCE concentrations in M-5MW16 ranged from 0.74 J µg/L (Round 44) to 37.11 µg/L (Round 39). TCE concentrations exceeded the GWQS of 1.0 µg/L in seven of nine sampling rounds for the current reporting period. Figure 5-3B illustrates the TCE concentration over time throughout the LTM in monitoring well M-5MW16.
- Vinyl chloride concentrations in M-5MW16 ranged from ND to 7.33 µg/L (Round 42). Vinyl chloride concentrations exceeded the GWQS of 1.0 µg/L in six of nine sampling rounds for the current reporting period. Figure 5-3C illustrates the vinyl chloride concentration over time throughout the LTM in monitoring well M-5MW16.
- PCE concentrations in M-5MW19 ranged from ND to 2.36 µg/L (Round 43). PCE concentrations exceeded the GWQS of 1.0 µg/L in two of nine sampling rounds for the current reporting period. Figure 5-4A illustrates the PCE concentration over time throughout the LTM in monitoring well M-5MW19.
- TCE concentrations in M-5MW19 ranged from ND to 5.01 µg/L (Round 43). TCE concentrations exceeded the GWQS of 1.0 µg/L in five of nine sampling rounds for the current reporting period. Figure 5-4B illustrates the TCE concentration over time throughout the LTM in monitoring well M-5MW19.
- PCE concentrations in M-5MW20 ranged from ND to 2.41 µg/L (Round 46). PCE concentrations exceeded the GWQS of 1.0 µg/L in six of nine sampling rounds for the current reporting period. Figure 5-5A illustrates the PCE concentration over time throughout the LTM in monitoring well M-5MW20.
- TCE concentrations in M-5MW20 ranged from ND to 1.65 J µg/L (Round 46). TCE concentrations exceeded the GWQS of 1.0 µg/L in two of nine sampling rounds for the current reporting period. Figure 5-5B illustrates the TCE concentration over time throughout the LTM in monitoring well M-5MW20.
- PCE concentrations in M-5MW23 ranged from ND to 16.0 µg/L (Round 41). PCE concentrations exceeded the GWQS of 1.0 µg/L in eight of nine sampling rounds for the current reporting period. Figure 5-6 illustrates the PCE concentration over time throughout the LTM in monitoring well M-5MW23.
- PCE concentrations in M-8MW12 ranged from ND to 9.83 µg/L (Round 47). PCE concentrations exceeded the GWQS of 1.0 µg/L in four of nine sampling rounds for the current reporting period. Figure 5-7A illustrates the PCE concentration over time throughout the LTM in monitoring well M-8MW12.
- TCE concentrations in M-8MW12 ranged from ND to 5.12 µg/L (Round 47). TCE concentrations exceeded the GWQS of 1.0 µg/L in two of nine sampling rounds for the current reporting period. Figure 5-7B illustrates the TCE concentration over time throughout the LTM in monitoring well M-8MW12.
- Vinyl chloride concentrations in M-8MW23 ranged from ND to 2.73 µg/L (Round 46). Vinyl chloride concentrations exceeded the GWQS of 1.0 µg/L in one of the nine sampling rounds. Figure 5-8 illustrates the vinyl chloride concentration over time throughout the LTM in monitoring well M-8MW23.

All other monitoring wells had PCE, TCE, and vinyl chloride concentrations that were non-detect or below their respective NJDEP GWQS. *cis*-1,2-DCE concentrations did not exceed the GWQS in any of the 13 wells reported in this RAPR during this reporting period.

5.2 Surface Water Sampling Results

Quarterly surface water samples were collected at three locations (SS-15 upstream on Mill Creek, SS-05 adjacent along Mill Creek, and SS-27 downgradient on Parkers Creek) during the current sampling period (Surface Water Sampling Rounds 41 through 49). SS-04 and SS-16 were not sampled during this period and were last sampled 3rd Quarter 2004 (Surface Water Round 32). Results for surface water samples from inception of LTM are summarized in Table 5-17 through Table 5-21. Surface water summary tables include detected analytical results for the surface water sample locations and are divided by surface water sample number and sampling date. A total of nine quarterly surface water sampling events were conducted from December 2006 through December 2008. The surface water sampling results from SS-05, SS-15, and SS-27 were compared to the appropriate freshwater NJDEP SWQS. Concentrations of VOCs and metals that exceeded their respective SWQS are summarized in Table 5-22. Surface water contaminant distributions over time are presented in Figure 5-1B. The results of the current surface water sampling events are discussed below.

The results in the surface water summary tables include analyte detections as well as exceedances of the NJDEP SWQS, which are bolded and shaded. VOCs, metals and wet chemistry parameters are presented as required to summarize results for detected compounds. Detections are presented in the surface water sampling result summary tables as follows:

- Xylenes are reported as total xylenes (the sum of *o*-xylene and *m,p*-xylenes).
- TICs are added and reported as a total concentration for the sum of TICs detected for VOCs.
- Duplicate samples are included after the respective primary sample.
- A "J" value is a concentration exceeding the MDL but less than the Reporting Limit (RL) for VOCs.
- Estimated Results "ER" are concentrations exceeding the MDL and less than the RL for metals.
- A "B" value is a compound detected in the sample and its associated field blank sample.
- If a particular sample suite or analyte was not detected in a surface water sample location, the suite/analyte is not presented in the summary table.

One surface water sample location (SS-05) sampled during the current reporting period (4th Quarter 2006 through the 4th Quarter 2008) was analyzed for VOCs and wet chemistry parameters. Two surface water sample locations (SS-15 and SS-27) sampled during the current reporting period (4th Quarter 2006 through the 4th Quarter 2008) were analyzed for VOCs, metals, and wet chemistry. Analysis for metals was started for both surface water sample locations (SS-15 and SS-27) from Round 33.

VOCs

During nine quarterly sampling events for the current reporting period, six VOCs were detected in the three surface water locations. Two VOCs (PCE and TCE) were detected at concentrations

that exceeded their respective freshwater SWQS. The remaining four VOCs [acetone, *cis*-1,2-DCE, methyl *tert*-butyl ether (MTBE), and *tert*-butyl alcohol (TBA)] were detected below their respective freshwater SWQS.

Analytical results for one surface water sample location (SS-15) sampled during the current reporting period exceeded the NJDEP freshwater SWQS for PCE and TCE. Surface water sampling point SS-15 is located upstream of the M-5 Landfill Site and outside of the Fort Monmouth property boundary. Surface water sampling point SS-05, immediately adjacent to the M-5 Landfill Site and downstream, exceeded the NJDEP freshwater SWQS for PCE during the current reporting period.

Metals

Two metals (arsenic and lead) were detected at concentrations that exceeded their respective SWQS. The concentration of arsenic exceeded the NJDEP freshwater SWQS in surface water sample locations SS-15 and SS-27. The concentration of lead exceeded the NJDEP freshwater SWQS in surface water sample location SS-15. Lead was detected below the maximum background concentration for surface water established in the *Weston (1995) report*. Arsenic was detected greater than the maximum background concentration.

5.2.1 Surface Water Contaminants of Concern

The following paragraphs summarize the results of the COCs detected above the SWQS during the current reporting period:

- PCE concentrations in SS-05 ranged from ND to 1.86 µg/L (Round 42). PCE concentrations exceeded the freshwater SWQS of 0.34 µg/L in six of nine sampling rounds for the current reporting period.
- PCE concentrations in SS-15 ranged from ND to 2.42 µg/L (Round 46). PCE concentrations exceeded the freshwater SWQS of 0.34 µg/L in six of nine sampling rounds for the current reporting period.
- TCE concentrations in SS-15 ranged from ND and 1.02 J µg/L (Round 46). TCE concentrations exceeded the freshwater SWQS of 1.0 µg/L in two of nine sampling rounds for current reporting period.

5.3 Tentatively Identified Compounds (TICs)

During this reporting period, VOC TIC concentrations in ground water did not exceed the NJDEP GWQS of 100 µg/L for individual compounds or 500 µg/L for total TIC concentrations. Table 5-23 summarizes the analytical results for the ground water VOC TICs during this reporting period.

During this reporting period, all three surface water sample locations had VOC TICs detected at very low level concentrations of one single TIC ranging from 7 µg/L to 11 µg/L. None of the three surface water sample locations had VOC TIC concentrations that exceeded either the NJDEP SWQS of 100 µg/L for an individual compound or 500 µg/L for total TIC concentrations. Table 5-24 summarizes the analytical results for the surface water VOC TICs during this reporting period.

5.4 Ground Water Sampling - Quality Assurance/Quality Control (QA/QC)

To verify the reliability of the ground water analytical results, VEETech reviewed the holding times for each sample and the results of the analyses of 12 method blanks, 11 trip blanks, 11 field blanks, and 10 field duplicate samples for the ground water samples. The discussion below is based on QA/QC for the ground water samples. Samples were analyzed by the FMETL within the prescribed holding time requirements for the analytical method.

Method Blanks

Laboratory method blanks accompanied each batch of samples for the M-5 Landfill Site. These method blanks consisted of laboratory-grade water that was processed identically to the samples and analyzed with the sample batch. A total of 12 method blanks were analyzed with the M-5 Landfill Site samples.

Acetone was detected in two of the method blanks at concentrations of 1.35 µg/L (Round 40) and 0.99 µg/L (Round 41), below the NJDEP GWQS of 6,000 µg/L for acetone.

Methylene chloride was detected in one of the method blanks at a concentration of 3.5 µg/L (Round 46), above the NJDEP GWQS of 2.5 µg/L for methylene chloride.

Acetone and methylene chloride are common laboratory contaminants, and detection in method blank samples is not indicative of a widespread laboratory contamination problem. COCs were not detected in the method blank samples.

Trip Blanks

A total of 11 trip blanks were included as part of the M-5 Landfill Site sampling program to document that volatile organics were not introduced into the samples during the handling process. The trip blanks were prepared by the FMETL and consisted of sample bottles filled with laboratory deionized water. The trip blanks remained with the sample bottles in coolers and were returned to the laboratory for analysis along with the ground water samples.

Acetone was detected in two of the trip blanks at concentrations of 1.14 µg/L (Round 44) and 11.87 µg/L (Round 46), below the NJDEP GWQS of 6,000 µg/L for acetone.

Chloroform was detected in one of the trip blank samples at a concentration of 0.46 µg/L (Round 40), below the NJDEP GWQS of 70 µg/L for chloroform.

Acetone and chloroform are common laboratory contaminants and detection is not indicative of a widespread laboratory contamination problem. COCs were not detected in the trip blank samples.

Field Blanks

One field blank sample was obtained during each day's sampling activities to check for potential introduction of contaminants from the field sampling and equipment decontamination procedures. A total of 11 field blanks were collected during this reporting period of the M-5 Landfill Site sampling program. The field blanks were collected by rinsing deionized water, supplied by the laboratory, over the sampling equipment used for daily activities. The water was collected in clean laboratory supplied containers and submitted for analysis along with the M-5 Landfill Site ground water samples.

Acetone was detected in two of the field blanks at concentrations of 1.39 µg/L (Round 44) and 12.33 µg/L (Round 46), below the NJDEP GWQS of 6,000 µg/L for acetone.

Chloroform was detected in one of the trip blank samples at a concentration of 0.38 µg/L (Round 40), below the NJDEP GWQS of 70 µg/L for chloroform.

Acetone and chloroform are common laboratory contaminants. COCs were not detected in the field blanks.

Duplicate Samples

A total of 10 field duplicate samples were also collected during this reporting period for the M-5 Landfill Site sampling events to verify the consistency of the entire sampling and analytical procedure. One of the field duplicates collected (Round 44) was not analyzed. Two field duplicate samples were collected for two days of sampling for Round 40. A total of 10 duplicate analyses results were available for comparison. The Relative Percent Differences (RPDs) for the duplicate sample analyses ranged from 0.00 percent to 9.04 percent. The average RPD for the total set of duplicate analyses was 1.45 percent. The duplicate sample analyses indicate a high level of precision relative to typical environmental laboratory analytical result data sets.

5.5 Surface Water Sampling - QA/QC

Surface water sampling activities were conducted base wide for each stream sampling location every quarter in a single sampling event. To verify the reliability of surface water analytical results, VEETech reviewed the holding times for each sample and the results of the analyses of 16 method blanks, 11 trip blanks, 11 field blanks, and nine field duplicate samples for the surface water samples. The discussion below is based on QA/QC for the VOC surface water samples. Samples were analyzed by the FMETL within the prescribed holding time requirements for the analytical method.

Method Blanks

Laboratory method blanks accompanied each batch of surface water samples for the M-5 Landfill Site. These method blanks consisted of laboratory-grade water that is processed identically to the samples and analyzed with the sample batch. A total of 16 VOC method blanks were analyzed with the base wide surface water samples.

Acetone was detected in three of the 16 method blank samples at concentrations ranging from 0.82 to 1.59 µg/L. NJDEP did not establish a SWQS for acetone for freshwater. Acetone is a common laboratory contaminant and detection in three method blank samples is not indicative of a widespread laboratory contamination problem.

Methylene chloride was detected in one of the 16 method blank samples at a concentration of 0.66 µg/L, below the freshwater SWQS of 2.5 µg/L. Methylene chloride is also a common laboratory contaminant.

COCs were not detected in the method blank samples.

Trip Blanks

A total of 11 trip blanks were included as part of the base wide surface water sampling program to document that volatile organics were not introduced into the samples during the handling process. The trip blanks were prepared by the FMETL and consisted of sample bottles filled

with laboratory deionized water. The trip blanks remained with the sample bottles in coolers and were returned to the laboratory for analysis along with the surface water samples.

Chloroform was detected in two of the 11 trip blanks at concentrations of 0.74 and 082 µg/L, below the freshwater SWQS of 68 µg/L. Acetone was detected in two of the 11 trip blanks at concentrations of 13.50 and 22.34 µg/L. As previously stated, chloroform and acetone are common laboratory contaminants, and the detections are not indicative of a widespread laboratory contamination problem. COCs were not detected in the trip blanks.

Field Blanks

One field blank sample was obtained during each day's sampling activities to document the equipment decontamination procedures. A total of 11 field blank samples were collected during the base wide surface water sampling program. The field blanks were collected by rinsing deionized water, supplied by the laboratory, over the sampling equipment used for daily activities. The water was collected in clean laboratory supplied containers and submitted for analysis along with the surface water samples.

Chloroform was detected in two of the 11 field blanks at concentrations of 0.73 and 0.75 µg/L, below the freshwater SWQS of 68 µg/L. Acetone was detected in two of the 11 field blank samples at concentrations of 0.95 and 12.52 µg/L. Methylene chloride was detected in one of the 11 method blank samples at a concentration of 0.52 µg/L, below the freshwater SWQS of 2.5 µg/L. COCs were not detected in the field blanks.

Duplicate Samples

A total of nine field duplicate samples were also collected during the base wide surface water sampling events to verify the consistency of the entire sampling and analytical procedure. Results from two of the field duplicates collected for Round 46 were not analyzed by the laboratory and therefore were not reported in the analytical data report for that quarter. Two field duplicate samples were collected for two days of sampling for Round 43.

The results for the duplicate samples were close to those obtained for the original samples. The RPDs for the duplicate sample analyses ranged from 0.0 percent to 50 percent; however, the average RPD for the nine duplicates was 12.95 percent. Based on average RPDs, the QA/QC sample results indicate a reasonable level of precision.

6.0 REMEDIAL ACTION PROGRESS

The long-term ground water monitoring results indicate that the concentrations of PCE have decreased in monitoring wells where concentrations were above the GWQS at the onset of the first HRC® injection. Concentrations of PCE have continued to decrease in some monitoring wells, notably M-5MW11 and M-5MW16, through the current reporting period (4th Quarter 2006 through the 4th Quarter 2008). Concentrations of PCE in other wells appeared to stabilize, notably M-5MW19 and M-5MW20, and increased in M-8MW12 through the current reporting period. Concentrations of PCE degradation byproducts appear to have stabilized but continue to increase in some wells. Concentrations of PCE and breakdown byproducts (TCE and vinyl chloride) continued to exceed the NJDEP GWQS in monitoring wells located in the former HRC® injection areas during the current reporting period (M-8MW23 located in HRC-1, M-8MW12 located in HRC-2, M-5MW23 located in HRC-3, M-5MW11 located in HRC-4, M-5MW20 located in HRC-5, M-5MW19 located in HRC-6, and M-5MW16 located in HRC-7, illustrated in Figure 3-1). The highest concentrations of PCE remain in the upgradient monitoring well M-5MW16 located in HRC-7.

The long-term surface water sampling results indicate that the source of the chlorinated VOCs impacting Landfill Site M-5 is not currently impacting Mill Creek or Parkers Creek.

6.1 Cost of Remediation Incurred To Date

The total cost to date for the annual implementation of the remedial actions performed at the M-5 Landfill Site is approximately $1,277K (Appendix H). This includes the Preliminary Assessment Phase, Site Investigation, RI, Remedial Design (RD), RA, LTM, and reporting.

6.2 Conclusions

Figure 5-2 through Figure 5-8 illustrate the trend in concentrations of PCE and degradation byproducts over time at monitoring wells M-5MW11, M-8MW12, M-5MW16, M-5MW19, M-5MW20, M-5MW23, and M-8MW23 where these chlorinated VOCs were detected above their respective GWQS. During this reporting period, PCE and/or degradation byproducts were not detected in five of the 13 monitoring wells (M-5MW10, M-5MW12, M-5MW13, M-5MW14, and M-5MW18). Two wells, M-8MW23 and M-8MW24, had detections of PCE degradation byproducts below their respective GWQS; PCE was not detected during this reporting period.

PCE was detected above NJDEP GWQS in M-5MW11. PCE concentrations in M-5MW11 ranged from ND to 5.24 µg/L (Round 42). The NJDEP GWQS for PCE is 1 µg/L. PCE was ND in M-5MW11 in two rounds of sampling (Round 43 and 46). The other seven rounds exceeded the GWQS.

PCE was detected above NJDEP GWQS in M-5MW16. PCE concentrations in M-5MW16 ranged from 4.42 µg/L (Round 45) to 86.18 µg/L (Round 39). PCE was detected above NJDEP GWQS for all nine rounds in the current reporting period.

PCE was detected above NJDEP GWQS in M-5MW19 at concentrations of 2.01 µg/L (Round 47) and 2.36 µg/L (Round 43). PCE was either not detected or detected below the NJDEP GWQS for the remaining seven rounds in the current reporting period.

PCE was detected above NJDEP GWQS in M-5MW20 at concentrations ranging from 1.28J µg/L (Round 45) to 2.41 µg/L (Round 46). PCE was detected below NJDEP GWQS in M-5MW20 in Rounds 41, 43 and 44.

PCE was detected above NJDEP GWQS in M-5MW23 at concentrations ranging from 1.54J µg/L (Round 40) to 16.0 µg/L (Round 41). PCE was ND in M-5MW23 in one round of sampling (Round 43).

PCE was detected above NJDEP GWQS in M-8MW12 at concentrations ranging from 1.49J µg/L (Round 42) to 9.83 µg/L (Round 47). PCE was detected below NJDEP GWQS in M-5MW20 in Round 45 and was ND in Rounds 40, 41, 43, and 44.

PCE was either ND or detected below NJDEP GWQS in M-5MW10, M-5MW12 through M-5MW14, M-5MW18, M-8MW23, and M-8MW24 during this reporting period.

TCE was detected above NJDEP GWQS in M-5MW16 at concentrations ranging from 1.36J µg/L (Round 47) to 37.11 µg/L (Round 39). The NJDEP GWQS for TCE was 1 µg/L. TCE was detected below the NJDEP GWQS in M-5MW16 in two rounds of sampling (Rounds 44 and 45).

TCE was detected above NJDEP GWQS in M-5MW19 at concentrations ranging from 1.01J µg/L (Round 40) to 5.01 µg/L (Round 43). TCE was detected below NJDEP GWQS in M-5MW19 in Round 46 and was ND in Rounds 41, 42, and 45.

TCE was detected above NJDEP GWQS in M-5MW20 at concentrations of 1.41J µg/L (Round 40) and 1.65J µg/L (Round 46). TCE was either not detected or detected below the NJDEP for the remaining seven rounds in the current reporting period.

TCE was detected above NJDEP GWQS in M-8MW12 at concentrations of 3.12 µg/L (Round 39) and 5.12 µg/L (Round 47). TCE was detected below the NJDEP GWQS in Rounds 42 and 46 and was ND for Rounds 40, 41, 43, 44, and 45.

TCE was either not detected or detected below NJDEP GWQS in M-5MW10 through M-5MW14, M-5MW18, M-5MW23, M-8MW23, and M-8MW24.

cis-1,2-DCE was either not detected or detected below NJDEP GWQS in the 10 monitoring wells associated with the M-5 Landfill Site and the three monitoring wells associated with M-8 Landfill Site.

Vinyl chloride was detected above NJDEP GWQS in M-5MW16 at concentrations ranging from 1.17J µg/L (Round 41) to 7.33 µg/L (Round 42). The NJDEP GWQS for vinyl chloride was 1 µg/L. Vinyl chloride was ND in M-5MW16 in three rounds of sampling (Rounds 44, 45, and 47).

Vinyl Chloride was detected above NJDEP GWQS in M-8MW23 at a concentration of 2.73 µg/L in only one round of sampling (Round 46). Vinyl chloride was detected below the NJDEP GWQS in M-8MW23 in two rounds (Rounds 39 and 47) and was ND for the remaining six rounds.

Vinyl Chloride was either not detected or detected below NJDEP GWQS in M-5MW10 through M-5MW14, M-5MW18 through M-5MW20, M-5MW23, M-8MW12, and M-8MW24.

Concentrations of PCE and breakdown byproducts (TCE and vinyl chloride) continued to exceed the NJDEP GWQS in monitoring wells located in the former HRC® injection areas during the current reporting period (M-8MW23 located in HRC-1, M-8MW12 located in HRC-2, M-5MW23 located in HRC-3, M-5MW11 located in HRC-4, M-5MW20 located in HRC-5, M-5MW19 located in HRC-6, and M-5MW16 located in HRC-7, illustrated in Figure 3-1). The highest concentrations of PCE remain in the upgradient monitoring well M-5MW16 located in HRC-7.

COCs were not detected above SWQS at the surface water sampling location immediately adjacent to and downgradient of the M-5 Landfill Site on Mill Creek (SS-05) or at the surface water sampling location downstream on Parker's Creek (SS-27) during this reporting period.

6.3 Recommendations

Although COC concentrations (PCE in particular) have decreased since the first HRC® injection, COC concentrations appear to have stabilized. VEETech recommends continued quarterly ground water and surface water monitoring activities. Additionally, if increased reduction in COCs is desired, additional biological or chemical oxidation treatment events may be warranted. The last HRC® injection event was performed between September and December 2005. The ground water monitoring wells that continue to exceed the GWQS are those within the existing HRC® injection areas (Figure 3-1).

Due to lack of detections of COCs and lack of exceedances of GWQS in six of the ground water monitoring wells currently being sampled during this reporting period, a modification to the monitoring program is required. Future sampling and analysis recommendations are summarized by well in the following section. Remedial action progress will be monitored and reported to the NJDEP periodically.

The Fort Monmouth DPW is currently reviewing soil and ground water data for the M-5 Landfill to determine if any additional delineation monitoring wells and/or soil borings will need to be installed prior to the calculation and submittal of a Classification Exception Area (CEA). In the next RAPR, if determined to be necessary, the Fort Monmouth DPW will include a delineation proposal for soil and ground water.

The Fort Monmouth DPW acknowledges receipt of the NJDEP's most recent correspondence letter (December 16, 2009). The DPW will prepare a response to the December 16, 2009 correspondence letter for inclusion in the next RAPR. As referenced in the December 16, 2009 NJDEP letter, the next RAPR will also include a comparison of all surface soil sampling analytical results to the NJDEP's *Non-Residential Direct Contact Soil Remediation Standards*. Previously, soil sampling results were compared to the NJDEP's *Residential Direct Contact Soil Remediation Standards*.

6.3.1 Sampling Program

The following table provides a summary of the current quarterly ground water and surface water sampling program at the M-5 Landfill Site along with recommendation for reduced sampling and analyses. While it is recommended to discontinue sampling for M-5MW10, DPW proposes to continue to collect liquid level measurements from the well to aid in the generation of ground water contour maps.

Monitoring Well	Analysis	Recommended Future Sampling	Reason
M-5MW10	VOCs	Discontinue Sampling.	COCs not detected since inception of monitoring. Redundant well with sentinel monitoring well M-5MW12.
M-5MW11	VOCs	Continue VOCs Quarterly	Exceedances of PCE.
M-5MW12	VOCs	Continue Sampling	Need as sentinel well for CEA.
M-5MW13	VOCs	Continue Sampling	Need as sentinel well for CEA.
M-5MW14	VOCs	Continue Sampling	Need as sentinel well for CEA.
M-5MW16	VOCs	Continue VOCs Quarterly	Exceedances of PCE, TCE, and vinyl chloride.
M-5MW18	VOCs	Continue Sampling	Need well sampled for CEA calculations.
M5-MW19	VOCs	Continue VOCs Quarterly	Exceedances of PCE and TCE.
M-5MW20	VOCs	Continue VOCs Quarterly	Exceedances of PCE and TCE.

SS-15	VOCs	Continue VOCs Quarterly	Upstream location.
SS-27	VOCs	Continue VOCs Quarterly	Downstream location.

6.4 Remedial Action Schedule

The table and Gantt chart provided in Appendix H is a schedule summary for remedial activities at the M-5 Landfill Site from the Preliminary Assessment phase through the end of this reporting period and estimated into the future. This table/chart includes actual costs and schedule to date and estimated/anticipated costs and schedule projected for future activities.

NOTE: THIS IS A COURTESY COPY OF THIS RULE. ALL OF THE DEPARTMENT'S RULES ALL COMPILED IN TITLE 7 OF THE NJ ADMINISTRATIVE CODE.

APPENDIX G
Contour Map Reporting Form

This reporting form shall accompany each ground water contour map submittal. Use additional sheets as necessary.

M-5 Landfill Site Figure 4-1 (contour map not constructed) (November 16 & 17, 2006)

1. Did any surveyed well casing elevations change from the previous sampling event? Yes___ No X. If yes, attach new "Well Certification - Form B – Location Certification" as found in the "Guide for the Submission of Remedial Action Workplans" (NJDEP, March 1995) and identify the reason for the elevation change (damage to casing, installation of recovery system in monitoring well, etc.).

2. Are there any monitor wells in unconfined aquifers in which the water table elevation is higher than the top of the well screen? Yes___ No X. If yes, identify these wells.

3. Are there any monitor wells present at the site but omitted from the contour map? Yes X No___. Unless the omission of the well(s) has been previously approved by the Department, justify the omissions.

Due to the ground water gauging event occurring on separate days, a contour map has not been generated.

4. Are there any monitor wells containing separate phase product during this measuring event? Yes___ No X. Were any of the monitor wells with separate phase product included in the ground water contour map? Yes___ No___. If yes, show the formula used to correct the water table elevation.

5. Has the ground water flow direction changed more than 45 degrees from the previous ground water contour map? Yes___ No___. If yes, discuss the reasons for the change. N/A

NOTE: THIS IS A COURTESY COPY OF THIS RULE. ALL OF THE DEPARTMENT'S RULES ALL COMPILED IN TITLE 7 OF THE NJ ADMINISTRATIVE CODE.

6. Has ground water mounding and/or depressions been identified in the ground water contour map? Yes___ No___. Unless the ground water mounds and/or depressions are caused by the ground water remediation system, discuss the reasons for this occurrence.

N/A

7. Are all the wells used in the contour map screened in the same water-bearing zone? Yes_X_ No___. If no, justify inclusion of those wells.

8. Were the ground water contours computer generated___, computer aided_X_, or hand-drawn___? If computer aided or generated, identify the interpolation method(s) used.

N/A

NOTE: THIS IS A COURTESY COPY OF THIS RULE. ALL OF THE DEPARTMENT'S RULES ALL COMPILED IN TITLE 7 OF THE NJ ADMINISTRATIVE CODE.

APPENDIX G
Contour Map Reporting Form

This reporting form shall accompany each ground water contour map submittal. Use additional sheets as necessary.

M-5 Landfill Site Figure 4-2 (contour map not constructed) (March 7 & 8, 2007)

1. Did any surveyed well casing elevations change from the previous sampling event? Yes___ No_X_. If yes, attach new "Well Certification - Form B – Location Certification" as found in the "Guide for the Submission of Remedial Action Workplans" (NJDEP, March 1995) and identify the reason for the elevation change (damage to casing, installation of recovery system in monitoring well, etc.).

2. Are there any monitor wells in unconfined aquifers in which the water table elevation is higher than the top of the well screen? Yes___ No_X_. If yes, identify these wells.

3. Are there any monitor wells present at the site but omitted from the contour map? Yes_X_ No___. Unless the omission of the well(s) has been previously approved by the Department, justify the omissions.

Due to the ground water gauging event occurring on separate days, a contour map has not been generated.

4. Are there any monitor wells containing separate phase product during this measuring event? Yes___ No_X_. Were any of the monitor wells with separate phase product included in the ground water contour map? Yes___ No___. If yes, show the formula used to correct the water table elevation.

5. Has the ground water flow direction changed more than 45 degrees from the previous ground water contour map? Yes___ No___. If yes, discuss the reasons for the change. N/A

NOTE: THIS IS A COURTESY COPY OF THIS RULE. ALL OF THE DEPARTMENT'S RULES ALL COMPILED IN TITLE 7 OF THE NJ ADMINISTRATIVE CODE.

6. Has ground water mounding and/or depressions been identified in the ground water contour map? Yes___ No_X_. Unless the ground water mounds and/or depressions are caused by the ground water remediation system, discuss the reasons for this occurrence.

N/A

7. Are all the wells used in the contour map screened in the same water-bearing zone? Yes_X_ No___. If no, justify inclusion of those wells.

8. Were the ground water contours computer generated___, computer aided___, or hand-drawn___? If computer aided or generated, identify the interpolation method(s) used.

N/A

NOTE: THIS IS A COURTESY COPY OF THIS RULE. ALL OF THE DEPARTMENT'S RULES ALL COMPILED IN TITLE 7 OF THE NJ ADMINISTRATIVE CODE.

APPENDIX G
Contour Map Reporting Form

This reporting form shall accompany each ground water contour map submittal. Use additional sheets as necessary.

M-5 Landfill Site Figure 4-3 (contour map not constructed) (June 6, 7 & 8, 2007)

1. Did any surveyed well casing elevations change from the previous sampling event? Yes___ No_X_. If yes, attach new "Well Certification - Form B – Location Certification" as found in the "Guide for the Submission of Remedial Action Workplans" (NJDEP, March 1995) and identify the reason for the elevation change (damage to casing, installation of recovery system in monitoring well, etc.).

2. Are there any monitor wells in unconfined aquifers in which the water table elevation is higher than the top of the well screen? Yes___ No_X_. If yes, identify these wells.

3. Are there any monitor wells present at the site but omitted from the contour map? Yes_X_ No___. Unless the omission of the well(s) has been previously approved by the Department, justify the omissions.

Due to the ground water gauging event occurring on separate days, a contour map has not been generated.

4. Are there any monitor wells containing separate phase product during this measuring event? Yes___ No_X_. Were any of the monitor wells with separate phase product included in the ground water contour map? Yes___ No___. If yes, show the formula used to correct the water table elevation.

5. Has the ground water flow direction changed more than 45 degrees from the previous ground water contour map? Yes___ No___. If yes, discuss the reasons for the change. N/A

Notes:

(1) Elevation of survey mark at top of casing (TOC).

(2) Depth to water (DTW) is collected on multiple days.

(3) Depth to water in feet from TOC.

(4) Ground water elevation in feet above mean sea level (msl).

NM = Not Measured.

Notes:

*TICs - Tentatively identified compounds, cannot exceed 500 ppb for VOCs and SVOCs. No individual compound can exceed 100 ppb.

**NJDEP Ground Water Quality Standards as per N.J.A.C. 7:9-6 (Jan. 7, 1993)

Exceedances of NJDEP Ground Water Quality Standards are shaded and bold

B - Compound detected in the sample and its associated blank sample

ER - Estimated result

J - Estimated concentration exceeds the MDL and is less than the RL

NA - Not analyzed

ND - Not detected

NLE - No limit established

Sampling for Semivolatiles and Metals were discontinued as per NJDEP approval dated November 2004

Notes:

*TICs - Tentatively identified compounds, cannot exceed 500 ppb for VOCs and SVOCs. No individual compound can exceed 100 ppb.

**NJDEP Groundwater Quality Standards as per N.J.A.C. 7:9-6 (Jan. 7, 1993)

(1)Low flow sampling method used to collect sample

Exceedances of NJDEP Groundwater Quality Standards are shaded and bold

Total Xylenes= ∑ of *o* -Xylene and *m,p* -Xylene.

ER - Estimated result

J - Estimated concentration exceeds the MDL and is less than the RL

NA - Not analyzed

ND - Not detected

NLE - No limit established

Sampling for Semivolatiles and Metals were discontinued as per NJDEP approval dated November 2004

Notes:

[1] Health based NDEP Surface Water Quality Criteria as per N.J.A.C. 7:9B effective 4/

mg/L and µg/L = milligrams/liter and micrograms/liter, respectively

cfu/100 mL = colony-forming units/100 milliliters

B - Compound detected in the sample and its associated blank sample

ER - Estimated result

Exceedences of NJDEP SWQC are shaded and bold

J - Estimated concentration exceeds the MDL and is less than the RL

NA - Not analyzed

ND - Not detected

NLE - No limit established

Total xylenes= Σ of *o*-xylene and *m,p*-xylene

Re: M-5 Landfill Site (FTMM-05) Remedial Action Progress Report: October 2003 through September 2005 (4th Qtr. 2003 – 3rd Qtr. 2005) Dated: March 2009 Fort Monmouth, New Jersey

Dear Mr. Quinn:

Submitted for your review and edification, please find a copy of the Remedial Action Progress Report (RAPR) for the M-5 Landfill Site (FTMM-05), Fort Monmouth, New Jersey. This RAPR was prepared in accordance with the *Technical Requirements for Site Remediation* (*TRSR*), New Jersey Administrative Code (N.J.A.C.) 7:26E-6.6 (February 2003). Enclosed please find the Electronic Delivery Documents (EDDs) as well as a completed RAPR Checklist.

Should you have any questions or require any additional information, please contact Mr. Charles Appleby, Environmental Protection Specialist, at 732-532-2692 or email: Charles.Appleby@US.Army.mil

Sincerely,

Joseph M. Fallon

Joseph M. Fallon, CHMM
Chief, Environmental Division

Attached: Completed Remedial Progress Report Checklist
Encl. 1: Remedial Action Progress Report, (4th Quarter 2003 through 3rd Quarter 2005)
Electronic Data Deliverable (EDDs), one disk in back of report

Encl. 2, Completed Remedial Progress Report Checklist

SRP CHECKLIST:		REMEDIAL ACTION PROGRESS REPORT 4th Quarter 2003 through 3rd Quarter 2005 M-5 Landfill Site (FTMM-05)		
	N.J.A.C. 7:26E-	Use this checklist to assure that the remedial action progress report is complete and meets all technical requirements.	Included: Yes/No/NA	Page #
	6.6(a)	Have progress reports been submitted as required?	Yes	2.2.3 and 2.2.4
	6.6(b)1	Is a description of each remedial action included and adequate?	Yes	3-1
	6.6(b)2	Is a discussion of problems and proposal for correction included and adequate?	NA	
	6.6(b)3	Are proposals for deviation from approved WP adequately addressed?	NA	
		6.3(e)3iii If requesting to reduce sampling frequency have the requirements at 6.3(e)3ii and in Appendix C been met?	NA	
	6.6(b)4	Is a revised schedule included and adequate?	Yes	6.1 & App.G
	6.6(b)5	Is the status of permit applications included and adequate?	Yes	3.1 & 6.2
	6.6(b)6	Is a list of upcoming remedial actions included and adequate?	Yes	6.5 & App.G
	6.6(b)7	Is the cost of each remedial action adequately documented?	Yes	6.1 & App.G
	6.6(b)8	Is a table of sampling results, summary of data and conclusions included and adequate?	Yes	Sections 5 and 6 and the Tables Section
	6.6(b)9	Is information for active GW remediation included and adequate?	Yes	3-1
		6.6(b)9i Has a ground water Contour Map Reporting Form (Appendix G) been completed and included?	Yes	Figures Section, Behind each Contour Map
	6.6(b)10	Is information for natural GW remediation included and adequate?	Yes	Sections 4 and 5
	6.6(b)11	Is a description of wastes generated included and adequate?	Yes	3-3 & 4-4
	6.6(b)12	Has other important information been included:	NA	
		If not previously provided, has a map of the CEA been included along with a CEA Factsheet from Appendix F?	NA	
		If the RAPR includes a proposal to revise the CEA, has all the necessary information per 6.3 and Appendix F been included?	NA	
		Does the report indicate whether biennial certifications have been submitted for CEAs &/or DERs?	NA

EXECUTIVE SUMMARY

This Remedial Action Progress Report (RAPR) documents the quarterly sampling of 13 monitoring wells [10 located at the M-5 Landfill Site (FTMM-05) and three located at the adjacent M-8 Landfill Site (FTMM-08)] from the 4th Quarter 2003 through the 3rd Quarter 2005 (Rounds 27 through 34) to monitor the progress of the enhanced natural attenuation program [Hydrogen Release Compound® (HRC)] in reducing contaminant levels in groundwater.

The M-5 Landfill Site consists of approximately 3.2 acres located on the western portion of the Main Post, just west of the Eatontown/Oceanport Borough line. The site is bordered by Mill Creek and Parkers Creek to the west and is adjacent to the southern boundary of the M-8 Landfill.

Groundwater monitoring of the site identified concentrations of tetrachloroethene (PCE) above the Groundwater Quality Criteria (GWQC) for Class II-A aquifers. The Remedial Investigation Report/Remedial Action Work Plan (RIR/RAWP) was submitted by ATC in February 2000 and approved by the New Jersey Department of Environmental Protection (NJDEP) in March 2001. The RAWP proposed enhanced natural attenuation with groundwater monitoring as the site remedy for the contaminant of concern (COC), tetrachloroethene (PCE). Predictive modeling indicated that the plume would degrade to below GWQC within a five-year period, and the plume was not predicted to migrate during this time frame.

Analytical results for six monitoring wells during the current reporting period exceeded the NJDEP GWQC for PCE and TCE. Analytical results for two monitoring wells exceeded the GWQC for cis-1,2-dichlroethene (DCE). Therefore, TCE and cis-1,2-DCE have been added as COCs at the M-5 Landfill Site. PCE, TCE, and cis-1,2-DCE concentrations have not exceeded their respective criteria in any of the wells bordering Mill Creek during this reporting period.

Tetrachloroethene (PCE) was detected above the GWQC of 1.0 µg/L in six wells with concentrations ranging from 1.08 µg/L (M-5MW11, Sampling Round 27) to 90.59 µg/L (M-5MW16, Round 33). **Trichloroethene (TCE)** was detected above the GWQC of 1.0 µg/L in six wells with concentrations ranging from 1.02 µg/L (M-5MW23, Round 28) to 34.20 µg/L (M-5MW16, Round 33). **Cis-1,2-dichloroethene (DCE)** was detected above the GWQC of 10.0 µg/L in two wells, with concentrations ranging from 13.20 µg/L (M-5MW20, Round 33) to 283.79 µg/L (M-5MW16, Round 34).

During this reporting period, surface water samples were collected from four surface water locations and analyzed for volatile organic compounds (VOCs); PCE and TCE were detected at one location, SS-15, at concentrations exceeding its Surface Water Quality Criteria (SWQC). However, the source of this contaminant (PCE and daughter products) has been identified as being upgradient of the Fort Monmouth property.

Although concentrations of PCE have fluctuated over time (specifically in M-5MW11, M-5MW16, M-5MW19, M-5MW20, M-5MW23, M-8MW12, and M-8MW23), the PCE levels have generally decreased in all monitoring wells where concentrations were above the GWQC at the onset of the first HRC® injection and the breakdown product concentrations have increased. The conclusion is that HRC® injections have enabled natural attenuation to proceed at an increased rate. Areas around M-5MW16, M-5MW19, M-5MW20, and M-5MW23 are still of concern. Based on the decreasing trend of PCE over time, VEETech recommends that the DPW continue quarterly groundwater and surface water sampling and monitoring activities.

1.0 INTRODUCTION

An enhanced natural attenuation program to remediate the contaminant of concern (COC), tetrachloroethene (PCE), at the M-5 Landfill Site (FTMM-05), located at the Main Post Area of Fort Monmouth, New Jersey, is being conducted in accordance with the Remedial Action Work Plan (RAWP) prepared by ATC, Inc. in February 2000 and approved by the New Jersey Department of Environmental Protection (NJDEP) in March 2001. Under contract number W9125S-05-D-0004, the U.S. Army Garrison Fort Monmouth, Directorate of Public Works has issued a delivery order (DO #2VO1) to VEETech, P.C. (VEETech) to prepare this Remedial Action Progress Report (RAPR). The report documents groundwater and surface water monitoring during the current reporting period of the 4th Quarter 2003 through the 3rd Quarter 2005 (Rounds 27 through 34).

1.1 Objectives

The objective of this RAPR is to document the implementation of the remedial action program performed at the M-5 Landfill Site during the current reporting period of the 4th Quarter 2003 through the 3rd Quarter 2005 following the 4th Hydrogen Release Compound® (HRC) injection event performed between June and August 2004. HRC® injections were implemented by the DPW as a Remedial Action (RA) based on the recommendations found in the Remedial Investigation Report/Remedial Action Work Plan (RIR/RAWP), prepared by ATC, dated February 2000, and approved by the New Jersey Department of Environmental Protection (NJDEP) in March 2001. The purpose of the RA was to treat the contaminant-affected areas at the site using HRC® to reduce the contaminant concentrations to comply with the NJDEP Class II-A aquifer Groundwater Quality Criteria (GWQC). The remedial activities were conducted in accordance with the NJDEP *Technical Requirements for Site Remediation* (February 2003), NJAC 7:26E, et seq. and the M-5 Landfill Site RIR/RAWP (Appendix B).

The RA and subsequent preparation of this RAPR encompassed the following:

- Applying HRC® treatment to seven areas of concern identified in ATC's RIR/RAWP within the M-5 Landfill Site where the most significant groundwater impacts were observed and documented,

- Conducting quarterly rounds of groundwater and surface water sampling and documenting the results to evaluate the effectiveness of the RA,

- Comparing the results of the groundwater and surface water sampling with the NJDEP GWQC and Surface Water Quality Criteria (SWQC),

- Identifying and discussing recommendations with the DPW for the continuation of this RA, and

- Documenting remedial activities as required by the NJDEP *Technical Requirements for Site Remediation* NJAC 7:26E et seq.

1.2 Report Organization

Section 2.0 discusses the site history and background information for the M-5 Landfill Site. Section 3.0 describes and summarizes the remedial activities (HRC® injection) conducted at the M-5 Landfill Site. Section 4.0 discusses groundwater and surface water monitoring and sampling activities at the site. Section 5.0 presents the analytical results of the groundwater and surface water sampling. Section 6.0 discusses the effectiveness of the RA and provides recommendations to the DPW for the M-5 Landfill Site. Section 7.0 is the reference section.

2.0 SITE BACKGROUND

The following sections describe the site background of the M-5 Landfill Site. Included is a description of the site location, site history, background investigations, and previous RAPRs.

2.1 Site Location and Description

Fort Monmouth is located in the central-eastern portion of New Jersey in Monmouth County, approximately 45 miles south of New York City and 70 miles northeast of Philadelphia (Figure 2-1). The M-5 Landfill Site is located on the western portion of the Main Post, just west of the Eatontown/Oceanport Borough line and east of Mill Creek and Parkers Creek, and consists of approximately 3.2 acres. The M-5 Landfill Site is adjacent to the southern boundary of the M-8 Landfill Site. According to a report prepared by the U.S. Army Toxic and Hazardous Materials Agency (USATHAMA) titled, *Installation Assessment of Fort Monmouth, Report 171*, dated May 1980, the M-5 Landfill was in use between 1952 and 1959 for general disposal of domestic and industrial wastes and also automobiles. This site has reportedly been inactive since 1959. Since 1959, there has been a steady growth and stabilization of vegetation (grass, trees, and bushes) on the site. The environmental setting (regional/local geology and hydrogeology) of the M-5 Landfill Site is described in ATC's RIR/RAWP, dated February 2000 (Appendix B).

2.2 Site History and Background Investigations

The U.S. Army Corps of Engineers (USACE), Baltimore District, initially contracted Roy F. Weston, Inc. (Weston) to perform a Site Investigation (SI) at Fort Monmouth, New Jersey. Suspected hazardous waste sites were initially identified at Fort Monmouth in a report prepared by the U.S. Army Toxic and Hazardous Materials Agency (USATHAMA, 1980). The USATHAMA report identified 37 sites with known or suspected waste materials on the Main Post and the two sub-posts (Charles Wood and Evans areas). Weston conducted a background investigation of the 37 sites, as well as eight additional sites that were identified by Fort Monmouth and the NJDEP. Weston's findings were described in a report titled *Investigation of Suspected Hazardous Waste Sites at Fort Monmouth, New Jersey (1993).* The M-5 Landfill Site was one of the 37 sites identified.

In 1995, Weston conducted a site investigation (SI) of the M-5 Landfill Site and prepared an SI Report (December 1995). The Weston SI Report, *Final Site Investigation, Fort Monmouth, New Jersey, Main Post and Charles Wood Areas* (Appendix A), was used as the basis for subsequent remedial investigations, which progressed to the development of remedial actions, including the remediation program at the M-5 Landfill Site. From May 1997 through September 1999, the Directorate of Public Works (DPW) conducted a Remedial Investigation (RI) of the site. ATC was contracted by the DPW to evaluate the data collected during the RI and prepare the RAWP (Appendix B).

2.2.1 Site Investigation Report – Weston

The Site Investigation (SI), performed by Weston in 1995, at the M-5 Landfill Site included installation and sampling of two groundwater monitoring wells [M-5MW10 (downgradient) and M-5MW11]. Surface water sampling was not performed for the M-5 Landfill Site, although

surface water had previously been sampled in conjunction with the M-2 Landfill Site, which is upgradient. Two rounds of groundwater sampling was performed and samples were analyzed for Target Compound List (TCL) plus 30 parameters (TCL+30), Target Analyte List (TAL) metals, sulfate, and cyanide.

A background study of the Main Post was conducted as part of the site investigation reported in 1995. Five borings on the Main Post were placed in areas believed to be unaffected by base activities, as specified by the 1993 *Investigation of Suspected Hazardous Waste Sites at Fort Monmouth, New Jersey report.* Two soil samples were collected from each of the five borings. The borings were converted to monitoring wells and two groundwater samples were collected from each well. Two sediment and surface water samples were also collected as part of the background study. Maximum background concentrations were then established and reported in the SI for soil, groundwater, surface water, and sediment for the Main Post Area of Fort Monmouth so that they could be compared to the analytical results from the SI (Weston, 1995).

Groundwater analytical data for one groundwater monitoring well indicated that tetrachloroethene (PCE) concentrations exceeding the NJDEP GWQC of 1.0 µg/L were present at the M-5 Landfill Site in well M-5MW11. There were no detections of sulfate, or cyanide above the NJDEP GWQC. Fourteen metals were detected in site groundwater; however, only four (aluminum, iron, manganese, and sodium) were found at concentrations exceeding the NJDEP GWQC, but were detected at concentrations below the maximum background concentrations established in the SI report (Weston, 1995) and are therefore not identified as Contaminants of Concern (COCs).

The Weston SI Report (1995) presented a proposal to the DPW for the M-5 Landfill Site that was subsequently implemented. A long-term groundwater and surface water monitoring program was proposed that utilized the existing groundwater-monitoring wells and surface water sampling locations to monitor and document the downgradient surface water and groundwater quality conditions over time.

An expanded SI, requested by the NJDEP, identified PCE as the only COC in groundwater at the M-5 Landfill Site. The DPW installed three additional wells (M-5MW12, M-5MW13, and M-5MW14) in 1998 as part of the expanded SI. This resulted in the performance of a Remedial Investigation (RI) encompassing soil and groundwater characterization to determine the extent of the impacts of PCE at the site.

2.2.2 RIR/Remedial Action Work Plan – ATC

From April 1995 through September 1999, the DPW performed an RI of the M-5 Landfill Site. ATC was contracted by the DPW to install additional groundwater monitoring wells, evaluate the data collected during the RI, and prepare the RAWP.

The following RI approach was established:

- Perform a Geoprobe® investigation of the soils and groundwater within the landfill to characterize the near-surface and subsurface soils and shallow groundwater to determine whether a source area existed for the PCE observed in the groundwater.

- Install additional groundwater-monitoring wells within the landfill and perform constant discharge pump tests to determine the aquifer characteristics of the shallow saturated zone beneath the M-5 Landfill Site.

- Incorporate the new wells into the quarterly groundwater-monitoring program.

- Continue quarterly surface water sampling to evaluate the potential impact to the stream from the PCE detected in the soils and shallow groundwater.

Geoprobe® Investigation

The RI involved the drilling of 261 Geoprobe® locations to facilitate the collection of soil and groundwater samples. The results of the RI indicated that PCE was detected at concentrations above the minimum detection limit (MDL) in seven of the soil borings and at concentrations that exceeded the NJDEP Impact to Groundwater Soil Cleanup Criteria (IGWSCC) of 1.0 milligrams per kilogram (mg/kg) in five samples (concentrations ranging from 1.1 µg/kg to 3.3 µg/kg). PCE was detected in groundwater samples collected from 105 boring locations at concentrations that exceeded the NJDEP GWQC for PCE of 1.0 µg/L.

Eight VOCs (PCE, trichloroethene (TCE), cis-1,2-dichloroethene (DCE), chlorobenzene, benzene, toluene, ethylbenzene, and total xylenes) were detected in groundwater samples above their respective method detection limits (MDL). Of these, PCE, TCE, cis-1,2-DCE chlorobenzene, and benzene were identified in groundwater at concentrations that exceeded their respective GWQC. PCE concentrations above the GWQC were detected in 105 samples. TCE (6 samples), cis-1,2-DCE (10 samples), chlorobenzene (5 samples), and benzene (9 samples) were detected in concentrations above their respective GWQC.

Monitoring Wells

A total of 15 groundwater monitoring wells, three (M-5MW10, M-5MW11, and M-8MW12) installed by Weston (1995), three (M-5MW12, M-5MW13, and M-5MW14) installed by the DPW (1998), and nine monitoring wells (M-5MW15, M-5MW16 M-5MW18, M-5MW19, M-5MW20, M-5MW23, M-5MW25, M-8MW23, and M-8MW24) installed by ATC (1999), have been incorporated in the groundwater-monitoring program at the M-5 Landfill Site. Monitoring well depths ranged from 14 to 20 feet below ground surface (bgs). Groundwater analytical results from the permanent monitoring wells identified PCE as the only contaminant of concern (COC) across the M-5 Landfill Site. Although PCE concentrations were expected to naturally attenuate to acceptable levels over time, the DPW proposed to actively remediate the affected areas at the M-5 Landfill Site by targeting seven specific locations and applying Hydrogen Release Compound (HRC®).

2.2.3 Remedial Action Progress Report, 2000-2002 – Versar

After the first and second HRC® injection periods and twelve rounds of groundwater monitoring well sampling (4th Quarter 1999 through 3rd Quarter 2002), Versar prepared a RAPR, dated August 2003. The RAPR documented the groundwater quality conditions over time and evaluated the impact of the HRC® injection program.

The initial injection of HRC® was performed between October and December 2000 and the second was performed between February and May 2002. These injection events were completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule agreement.

A generally decreasing trend of the concentrations of PCE and an increase in daughter (e.g. breakdown) product concentrations in groundwater were observed during the reporting period (4th Quarter 1999 through 3rd Quarter 2002). The results supported the contention that COC degradation is occurring at the M-5 Landfill Site, presumably due to the effectiveness of the HRC® injection program that supports the biodegradation processes.

Based on the concentrations of the COC in groundwater following the HRC® injections, the HRC® subsurface injection program was continued by the DPW.

2.2.4 Remedial Action Progress Report, 2002-2003 – Versar

The third HRC® injection round was performed by the DPW between June and August 2003. This injection event was completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule agreement. Versar prepared a second RAPR, dated September 2005, following the third injection event, for the reporting period 4th Quarter 2002 through 3rd Quarter 2003. Said RAPR documented the groundwater quality conditions over time and evaluated the effectiveness of the HRC® injection program.

A generally decreasing trend of PCE concentrations was observed in groundwater at the site throughout the four quarters of groundwater sampling. The results supported the contention that PCE degradation was occurring at the M-5 Landfill Site, presumably due to the effectiveness of the HRC® to support the biodegradation processes.

Based on the decreasing concentrations of the COC and the increased presence of degradation products in groundwater during the reporting period, the HRC® subsurface injection program was continued.

3.0 REMEDIAL ACTIVITIES

Sampling results documented in ATC's RIR/RAWP (February 2000) for the M-5 Landfill Site indicated that the shallow groundwater contained tetrachloroethene (PCE) at concentrations that exceeded the NJDEP GWQC. Although the COC concentrations in groundwater were expected to gradually decrease through natural attenuation, the DPW implemented an HRC® injection program to actively address the groundwater contamination at the site. This bioremediation involved treating seven areas identified in the RIR/RAWP where elevated concentrations of PCE were detected (Figure 3-1).

3.1 Hydrogen Release Compound®

HRC® is a proprietary, food quality, polylactate ester that, upon being deposited into the subsurface, creates anaerobic aquifer conditions and causes the release of hydrogen. Under anaerobic conditions, naturally occurring microorganisms use the hydrogen to progressively remove chlorine atoms from chlorinated hydrocarbons via reductive dechlorination. HRC® is a slow-release compound that provides a steady hydrogen source for between six months and one year, and has been shown to enhance the natural attenuation of PCE at other study sites. HRC® applications were conducted in accordance with the M-5 Landfill Site RIR/RAWP, prepared by ATC Associates, Inc. (ATC), dated February 2000, and approved by the NJDEP in March 2001.

The seven treatment areas designated for the application of HRC® are illustrated in Figure 3-1. Varying numbers of boring locations within each of the seven delineated areas (from 6 to 59), where concentrations of PCE were detected above the NJDEP GWQC, were selected for application of the biological enhancements.

The fourth HRC® injection event was performed between June and August 2004 using a Geoprobe® rig to install an array of temporary injection points around each of the selected boring locations. These injections points were established on 12 foot by 12 foot grids over each treatment area, for a total of 233 injection locations. Injection of the HRC® was continuous from four feet to eight feet below ground surface (bgs).

3.2 Discharge to Groundwater Permit

The purpose of the New Jersey Pollutant Discharge Elimination System (NJPDES) Discharge to Groundwater (DGW) permit is to request a formal approval of the HRC® subsurface injection program at the M-5 Landfill Site as described in the RAWP prepared by ATC (Appendix B). The fourth injection of HRC® was completed with the prior approval of the NJDEP under the provisions of a Permit-by-Rule agreement.

As described in the ATC RAWP, the HRC® injections do not result in the discharge of any hazardous compounds. A Material Data Safety Sheet (MSDS) for the HRC® is presented in Appendix C.

3.3 Types of Waste Generated and Disposal Methods

The waste types generated by the remedial activities included three-gallon polyethylene pails and personal protective equipment (PPE). The pails were recycled and the PPE was disposed of as non-hazardous waste.

4.0 MONITORING AND SAMPLING ACTIVITIES

As part of the Long Term Monitoring (LTM) program at the M-5 Landfill Site, quarterly groundwater monitoring (Rounds 27 through 34) and surface water sampling (Rounds 29 through 36) continued from the 4th Quarter 2003 through the 3rd Quarter 2005. Groundwater samples were collected from 10 monitoring wells (M-5MW10, M-5MW11, M-5MW12, M-5MW13, M-5MW14, M-5MW16, M-5MW18, M-5MW19, M-5MW20, and M-5MW23) at the M-5 Landfill Site and three monitoring wells (M-8MW12, M-8MW23, and M-8MW24) at the northern adjacent M-8 Landfill Site during eight quarterly sampling events. Surface water samples were collected from four locations (SS-4, SS-5, SS-15, and SS-16) along Mill Creek through the 3rd Quarter 2004 and in two locations (SS-5 and SS-15) from the 4th Quarter 2004 through the 3rd Quarter 2005.

Sampling was conducted by the DPW in accordance with the established protocols as described in the *Fort Monmouth Standard Sampling Operating Procedure [SOP No.: SAM-0205* (August 1999, Revised January 2003 and September 2004)] and the NJDEP *Field Sampling Procedures Manual*, May 1992 and August 2005. Both groundwater and surface water samples were analyzed for VOCs + 15. Surface water samples were also analyzed for polychlorinated biphenyls (PCBs). Laboratory analyses of the samples were conducted at the Fort Monmouth Environmental Testing Laboratory (FMETL), a New Jersey-certified laboratory (Certification No. 13461).

4.1 Groundwater Monitoring

During the current groundwater sampling program at the M-5 Landfill Site, groundwater was encountered at depths ranging from approximately 2-13 feet bgs (2.10 to 12.75 feet below top of well casing). Static depth to water measurements were collected from 12 monitoring wells on October 8, 2003, January 14, 2004, May 13, 2004, August 20, 2004, December 16, 2004, March 15, 2005, June 3, 2005, and September 16, 2005. Depths were not reported for monitoring wells M-5MW15 and M-5MW25 for the 4th Quarter 2004 or the 1st Quarter 2005. No separate-phase product was observed in any of the 12 monitoring wells during the reporting period. Figure 2-2 shows the locations of the monitoring wells. Depth to water measurements results are summarized in Table 4-1. Groundwater-elevation contour maps were generated for each round based on groundwater elevations calculated for 12 monitoring wells. These contour maps are presented in Figures 4-1 through Figure 4-8 along with the required NJDEP contour map reporting forms.

The contour maps indicate that shallow groundwater underlying the M-5 Landfill Site consistently flows to the west towards Mill Creek and Parkers Creek at elevations ranging from 2.05 to 10.15 feet above mean sea level (msl). No significant variations in groundwater flow conditions were observed through the current monitoring period.

4.2 Groundwater Sampling

Quarterly groundwater sampling of the 10 monitoring wells at the M-5 Landfill Site was conducted by the DPW. Quality control samples for the monitoring period included 12 method blanks, 10 trip blanks, 11 field blanks, and 8 duplicate samples.

Sampling equipment was thoroughly decontaminated before and after each use. Following collection, the groundwater samples were immediately placed in laboratory-supplied bottle ware. Sample containers were labeled, sealed, packed in ice, and transported to the FMETL under proper chain-of-custody procedures.

Copies of the chain-of-custody forms and the laboratory analytical data sheets are presented in Appendix D. A summary of the groundwater sampling activities for the remediation monitoring (Rounds 1 through 34); including round numbers, well IDs, sample IDs, sample locations, collection/analysis dates, analytical parameters, and analysis methods is provided in Table 4-2. Figure 2-2 shows the locations of the monitoring wells. The analytical results are discussed in Section 5.1.

4.3 Surface Water Sampling

Surface water sampling was conducted by the DPW for the current reporting period as part of a base-wide surface-water sampling program. A total of 24 surface water samples were collected over eight rounds of sampling from four locations (SS-4, SS-5, SS-15, and SS-16) along Mill Creek. SS-5 and SS-15 were sampled during eight quarterly sampling events from November 2003 through September 2005, and SS-4 and SS-16 were sampled during four sampling events from November 2003 through August 2004. Figure 2-2 shows the locations of surface water sample collection points. SS-15 and SS-16 are located upstream of the site. SS-4 is located downstream of the site. SS-5 is located adjacent to the M-5 Landfill Site. The samples were analyzed by the FMETL for VOCs and PCBs. The results of these analyses are discussed in Section 5.2.

Sampling equipment was thoroughly decontaminated before and after each use. Surface water samples were collected and immediately placed in laboratory-supplied bottle ware. Sample containers were labeled, sealed, packed in ice, and transported to the FMETL under proper chain-of-custody procedures.

Copies of the chain-of-custody forms and the laboratory analytical data are presented in Appendix E. Table 4-3 presents a summary of surface water sampling activities for Rounds 1 through 36 for sampling points SS-4, SS-5, SS-15, and SS-16; including sampling rounds, sample IDs, stream sampling locations, collection/analysis dates, analytical parameters, and analysis methods.

4.4 Types of Waste Generated and Disposal Methods

The waste types generated by the sampling activities included polyethylene tubing, Teflon® bailers, mason string, and personal protective equipment (PPE). The tubing, bailers, string, and PPE were disposed of as non-hazardous waste.

5.0 SAMPLING ANALYTICAL RESULTS

This section includes a summary discussion of the chemical characterization of the site based on the samples collected and analyzed for the current reporting period, including eight quarterly rounds of groundwater monitoring well samples and eight rounds of surface water samples.

5.1 Groundwater Sampling Results

Summaries of the analytical results from each of the 10 monitoring wells on the M-5 Landfill Site and the three monitoring wells on the M-8 Landfill Site for Rounds 1 through 34 are summarized in Tables 5-1 through Table 5-15. Analytes detected in groundwater samples at concentrations above their respective NJDEP GWQC are highlighted and shaded in the tables. Graphs depicting PCE (and daughter product) concentrations over time at wells M-5MW11, M-5MW16, M-5MW19, M-5MW20, M-5MW23, M-8MW12, and M-8MW23 are provided as Figures 5-2A through Figure 5-8C. A summary of results exceeding GWQC in the current reporting period is presented in Table 5-16. Figure 5-1A summarizes the analytical results for tetrachloroethene (PCE), TCE, and cis-1,2-DCE to include all remediation phase sampling events.

During eight quarterly sampling events for the current reporting period, 12 VOCs were detected in the ten M-5 and three M-8 groundwater samples. Five VOCs (benzene, chlorobenzene, ethylbenzene, 1,3-dichlorobenzene, and 1,4-dichlorobenzene) were identified only in M-8MW24. Benzene and chlorobenzene are contaminants of concern (COCs) at the M-8 Landfill Site. Seven VOCs [2-butanone, PCE, trichloroethene (TCE), cis-1,2-dichloroethene (DCE), vinyl chloride, benzene, and chlorobenzene] were detected at concentrations that exceeded their respective GWQC in more than one sample at the M-5 Landfill and M-8 Landfill monitoring wells, while five VOCs (ethylbenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, acetone, and chloroform) were detected below their respective GWQC at both sites. Based on these and previous results, daughter products, cis-1,2-DCE and TCE, have been added as COCs at the M-5 Landfill Site.

5.1.1 Contaminants of Concern

The following paragraphs summarize the results of the contaminants of concern (COCs) detected above the GWQC during the current reporting period:

- PCE concentrations in monitoring well M-5MW11 ranged from non-detect in Round 34 to 3.10 µg/L in Round 29. PCE concentrations exceeded the GWQC of 1.0 µg/L in seven of the eight sampling rounds.

- PCE concentrations in monitoring well M-5MW16 ranged from 6.22 µg/L in Round 32 to 90.59 µg/L in Round 33. In Round 34, PCE was detected at 9.51 µg/L. PCE concentrations exceeded the GWQC in all eight sampling rounds.

- PCE concentrations in monitoring well M-5MW19 ranged from non-detect in Rounds 29 and 31 through 33 to 5.73 µg/L in Round 34. PCE concentrations exceeded the GWQC in three of the eight sampling rounds.

- PCE concentrations in monitoring well M-5MW20 ranged from 3.96 µg/L in Round 31 to 43.96 µg/L in Round 27. In Round 34, PCE was detected at 8.74 µg/L. PCE concentrations exceeded the GWQC in all eight sampling rounds.

- PCE concentrations in monitoring well M-5MW23 ranged from non-detect in Round 30 to 23.07 µg/L in Round 33. In Round 34, PCE was detected at 7.24 µg/L. PCE concentrations exceeded the GWQC in seven of the eight sampling rounds.

- PCE concentrations in monitoring well M-8MW12 ranged from non-detect in Rounds 27 through 31 and Rounds 33 and 34 to 3.67 µg/L in Round 32. PCE concentrations exceeded the GWQC in one of the eight sampling rounds.

- TCE concentrations in monitoring well M-5MW11 ranged from non-detect in Rounds 30 through 34 to 1.2 µg/L in Round 29. TCE concentrations exceeded the GWQC of 1.0 µg/L in one of the eight sampling rounds.

- TCE concentrations in monitoring well M-5MW16 ranged from 2.80 µg/L in Round 32 to 34.20 µg/L in Round 33. In Round 34, TCE was detected at 34.10 µg/L. TCE concentrations exceeded the GWQC in all eight sampling rounds.

- TCE concentrations in monitoring well M-5MW19 ranged from non-detect in Rounds 30, 32, and 33 to 3.12 µg/L in Round 34. TCE concentrations exceeded the GWQC in five of the eight sampling rounds.

- TCE concentrations in monitoring well M-5MW20 ranged from non-detect in Round 31 to 8.55 µg/L in Round 33. In Round 34, TCE was detected at 2.67 µg/L. TCE concentrations exceeded the GWQC in six of the eight sampling rounds.

- TCE concentrations in monitoring well M-5MW23 ranged from non-detect in Round 27 and Rounds 30 through 33 to 2.07 µg/L in Round 29. In Round 34, TCE was detected at 0.89 µg/L. TCE concentrations exceeded the GWQC in two of the eight sampling rounds.

- TCE concentrations in monitoring well M-8MW12 ranged from non-detect in Round 27, Rounds 29 through 31, and Rounds 33 and 34 to 3.70 µg/L in Round 28. TCE concentrations exceeded the GWQC in two of the eight sampling rounds.

- Cis-1,2-dichloroethene concentrations in monitoring well M-5MW16 ranged from 22.47 µg/L in Round 29 to 283.79 µg/L in Round 34. Cis-1,2-DCE exceeded the GWQC of 10.0 µg/L in all eight sampling rounds.

- Cis-1,2-DCE concentrations in monitoring well M-5 MW20 ranged from non-detect in Round 29 to 13.20 µg/L in Round 33. In Round 34, cis-1,2-DCE was detected at 4.21 µg/L. Cis-1,2-DCE concentrations exceeded the GWQC in one of the eight sampling rounds.

Vinyl chloride was detected at M-8MW23 in two of the eight sampling rounds at 5.13 µg/L (Round 29) and 13.71 µg/L (Round 30), exceeding the GWQC of 5.0 µg/L in two of the eight

sampling rounds. The only other detections of vinyl chloride during all phases of sampling were below the GWQC in M-8MW23 at 2.40 µg/L (Round 28), 2.06 µg/L (Round 23), 1.18 µg/L (Round 10), and in M-5MW16 at 1.21 µg/L (Round 31). Therefore, vinyl chloride is not being named as a contaminant of concern at this time.

There was one detection during this reporting period of 2-butanone that exceeded the GWQC of 300 µg/L. The concentration of 2-butanone in monitoring well M-5MW11 was 448.97 µg/L in Round 27. The 2-butanone was not detected in the following seven sampling rounds (Rounds 28-34).

All other monitoring wells had PCE, TCE, and cis-1,2-DCE concentrations that were non-detect or below the NJDEP GWQC.

5.2 Surface Water Sampling Results

Quarterly surface water samples were collected along Mill Creek at two upstream locations (SS-15 and SS-16), one adjacent stream location (SS-5), and one downstream location (SS-4) during the current sampling period (Surface Water Sampling Rounds 29 through 36). Results for surface water samples for Rounds 1 through 36 (October 1996 through September 2005) are summarized in Tables 5-17 through Table 5-20. Surface water contaminant distributions over time are presented in Figure 5-1B. The results of the current surface water sampling events are discussed below.

Surface water sampling results were compared to the appropriate fresh or saline water NJDEP Surface Water Quality Criteria (SWQC). Concentrations of VOCs that exceeded their respective SWQC are summarized in Table 5-21.

During eight quarterly sampling events for the current reporting period, eight VOCs were detected in surface water samples. Two VOCs (PCE and TCE) were detected at concentrations that exceeded their respective SWQC in at least one sample from SS-15 only, while six VOCs were detected below their respective SWQC.

At SS-15 , PCE was detected at concentrations ranging from 1.25 µg/L (Rounds 32 and 36) to 2.92 µg/L (Round 34) above its SWQC of 0.388 µg/L. PCE concentrations exceeded the SWQC in all eight rounds of sampling. Also at SS-15, TCE was detected at 1.24 µg/L (Round 35), which exceeded the SWQC of 1.09 µg/L.

As previously noted, surface water sampling point, SS-15, is located upstream of the M-5 Landfill Site and outside of the Fort Monmouth property boundary. The concentrations of PCE and TCE observed entering the property west of the M-2 and M-5 Landfill Sites are not derived from Army activities at Fort Monmouth.

5.3 Tentatively Identified Compounds (TICs)

During this reporting period, seven of the 13 monitoring wells sampled did not have detected VOC tentatively identified compounds. These were M-5MW10, M-5MW13, M-5MW14, M-5MW16, M-5MW18, M-5MW20, and M-8MW23. Sampling results also indicated five of the other six monitoring wells had only one round of detected TICs. These results ranged from a

concentration of 3 µg/L to 29 µg/L. TICs were reported in five of the eight sampling rounds at M-8MW24. There were no results exceeding the NJDEP criteria of 100 µg/L for individual compounds or 500 µg/L for Total TIC concentrations. Table 5-22 lists the VOC TICs for this reporting period.

5.4 Quality Assurance/Quality Control (QA/QC)

To verify the reliability of the analytical results, VEETech reviewed the holding times for each sample and the results of the analyses of 12 method blanks, 10 trip blanks, 11 field blanks, and eight field duplicate samples for VOCs. Samples were analyzed by the FMETL within the prescribed holding time requirements for the analytical method.

Method Blanks

Laboratory method blanks accompanied each batch of samples for the M-5 Landfill Site. These method blanks consisted of laboratory-grade water that was processed identically to the samples and analyzed with the sample batch. A total of 12 method blanks were analyzed with the M-5 Landfill Site samples.

Two VOCs, acetone and chloroform, were detected in three method blank samples at concentrations below their respective GWQC. Both acetone and chloroform are common laboratory contaminants, and their detection in the method blank samples is not indicative of a widespread laboratory contamination problem. More importantly, none of the COCs (PCE, TCE, and cis-12,-DCE) were detected in any of the method blank samples.

Trip Blanks

A total of 10 trip blanks were included as part of the M-5 Landfill Site sampling program to document that volatile organics were not introduced into the samples during the handling process. The trip blanks were prepared by the FMETL and consisted of sample bottles filled with laboratory-deionized water. The trip blanks remained with the sample bottles in coolers and were returned to the laboratory for analysis with the groundwater samples.

Chloroform was detected in six of the 10 trip blanks; none of the detections exceeded the NJDEP groundwater criteria. As noted above, chloroform is a common laboratory artifact.

Field Blanks

One field blank sample was obtained during each day's sampling activities to document the equipment decontamination procedures. A total of 11 field samples (e.g., field blanks) were collected during the M-5 Landfill Site sampling program. The field blanks were collected by rinsing deionized water, supplied by the laboratory, over the sampling equipment used for each day's activities. The water was collected in clean laboratory-supplied containers and submitted for analysis with the M-5 Landfill Site groundwater samples.

Chloroform was detected in six of the 11 field blanks; none of the detections exceeded the NJDEP groundwater criteria. As noted above, chloroform is a common laboratory artifact. The COCs were not detected in any of the field blanks.

Duplicate Samples

A total of eight field duplicate samples were also collected during the M-5 Landfill Site sampling events to verify the consistency of the entire sampling and analytical procedure. The results for all of the duplicate samples were close to those obtained for the original samples. The relative percent differences (RPDs) for the duplicate sample analyses ranged from 0.0% to 200.0%, however, the average RPD for all of the results was 28.05%. Based on average RPDs, the QA/QC sample results indicate good precision.

6.0 REMEDIAL ACTION PROGRESS

The long-term groundwater monitoring results indicate the concentrations of PCE are decreasing and the daughter product concentrations are increasing in the groundwater at the M-5 Landfill Site as a result of enhanced natural attenuation. There is also no indication of plume migration and contamination from the M-5 Landfill Site is not impacting Mill Creek.

6.1 Cost of Remediation Incurred To-Date

The total cost-to-date from the annual implementation of the remedial actions performed at the M-5 Landfill Site is provided below:

M-5 LANDFILL (SITE # FTMM-05) FUNDING HISTORY

ACTUAL COST (THOUSANDS $)

YEAR	PA	SI	RI	RD	RA	RAO	LTM	TOTAL
1993	3.90							**3.90**
1994		43.40						**43.40**

6.2 Discharge to Groundwater Permit

A NJPDES DGW permit application was submitted in November 2001 to obtain approval for continuation of the HRC® injection program at the M-5 Landfill Site. The fourth HRC® injection event was performed between June and August 2004 as an extension of the NJDEP Permit-by-Rule approval. All subsequent HRC® injections will be performed under NJDEP regulatory requirements.

6.3 Conclusions

Figures 5-2A through Figure 5-8C illustrate the trend in concentrations of PCE and its daughter products over time at monitoring wells M-5MW11, M-5MW16, M-5MW19, M-5MW20, M-5MW23, M-8MW12, and M-8MW23 where PCE and its daughter products have been

detected above and below their respective GWQC. During this reporting period, PCE and its daughter products were not detected in six of the 13 monitoring wells (M-5MW10, M-5MW12, M-5MW13, M-5MW14, M-5MW18, and M-8MW24). Monitoring wells M-5MW15 and M-5MW25 were last sampled in July 2003.

The trends of PCE and its daughter (breakdown) products in groundwater over time after the implementation of the HRC® injection program are discussed below:

PCE was detected at concentrations exceeding the GWQC of 1.0 µg/L in one to eight sampling rounds collected from six monitoring wells. Concentrations ranged from 1.08 µg/L in M-5MW11 (Round 27) to 90.59 µg/L in M-5MW16 (Round 33). The PCE concentration in M-5MW16 decreased to 9.51 µg/L in Round 34.

TCE was detected at concentrations exceeding the GWQC of 1.0 µg/L in one to eight sampling rounds from six monitoring wells. Concentrations ranged from 1.02 µg/L in M-5MW23 (Round 28) to 34.20 µg/L in M-5MW16 (Round 33).

Cis-1,2-DCE was detected at concentrations exceeding the GWQC of 10 µg/L in one to eight sampling rounds collected from two monitoring wells. Concentrations ranged from 13.20 µg/L in M-5MW20 to 283.79 µg/L in M-5MW16 (Round 34).

Vinyl chloride, which has not been designated a COC, was detected at concentrations exceeding the GWQC of 5.0 µg/L in two rounds at M-8MW23. Concentrations were 5.13 (Round 29) and 13.71 µg/L (Round 30). Sampling results from all sampling rounds at the other 14 monitoring wells (11 at the M-5 Landfill and three at the M-8 Landfill) for vinyl chloride have been either non-detect or below the GWQC.

Although concentrations of PCE have fluctuated over time (specifically in M-5MW11, M-5MW16, M-5MW19, M-5MW20, M-5MW23, M-8MW12, and M-8MW23), the PCE levels have generally decreased in all monitoring wells where concentrations were above the GWQC at the onset of the first HRC® injection. The conclusion is that HRC® injections have enabled natural attenuation to proceed at an increased rate; however, as expected, daughter product concentrations have increased. Areas around M-5MW16, M-5MW19, M-5MW20, and M-5MW23 are still of concern.

6.4 Recommendations

Although COC concentrations have fluctuated in some wells, based on the generally decreasing trend of PCE and the increase of daughter products over time, VEETech recommends that the DPW continue quarterly sampling and monitoring activities. Remedial action progress will be monitored and reported to the NJDEP periodically.

6.4.1 Sampling Program

The following table provides a summary of the current quarterly groundwater and surface water sampling program at the M-5 Landfill Site. At this time, no change in the current program is planned. Any future alterations involving laboratory analyses and the elimination of certain wells from the program will be based on the distribution of the COCs over time.

Monitoring Well	Analysis	Future Sampling Status	Reason
M-5MW10	VOCs	Continue VOCs Quarterly	Downgradient of Contamination Source
M-5MW11	VOCs	Continue VOCs Quarterly	Exceedances of PCE and TCE
M-5MW12	VOCs	Continue VOCs Quarterly	Downgradient of Contamination Source
M-5MW13	VOCs	Continue VOCs Quarterly	Downgradient of Contamination Source
M-5MW14	VOCs	Continue VOCs Quarterly	Downgradient of Contamination Source
M-5MW16	VOCs	Continue VOCs Quarterly	Exceedances of PCE, TCE, & cis-1,2-DCE
M-5MW18	VOCs	Continue VOCs Quarterly	Downgradient of Contamination Source
M5-MW19	VOCs	Continue VOCs Quarterly	Exceedances of PCE and TCE
M-5MW20	VOCs	Continue VOCs Quarterly	Exceedances of PCE, TCE, & cis-1,2-DCE
M-5MW23	VOCs	Continue VOCs Quarterly	Exceedances of PCE and TCE
M-8MW12	VOCs	Continue VOCs Quarterly	Exceedances of PCE and TCE
M-8MW23	VOCs	Continue VOCs Quarterly	Exceedances of vinyl chloride and downgradient of contamination source
M-8MW24	VOCs	Continue VOCs Quarterly	COCs for M-5 Landfill Site not detected, but exceedances of benzene and chlorobenzene

Surface Water Location	Analysis	Future Sampling Status	Reason
SS-4	VOCs, PCBs	Discontinued	No COCs detected above SWQC in 32 rounds and was eliminated after the 3rd Quarter 2004
SS-5	VOCs, PCBs	Continue VOCs Quarterly	Exceedances of PCE
SS-15	VOCs, PCBs	Continue VOCs Quarterly	Exceedances of PCE and TCE
SS-16	VOCs, PCBs	Discontinued	No COCs detected above SWQC in 13 rounds and was eliminated after the 3rd Quarter 2004

6.5 Remedial Action Schedule

The table provided in Appendix G is a schedule summary for all remedial activities at the M-5 Landfill Site from the Preliminary Assessment phase through the end of this reporting period, 3rd Quarter 2005.

APPENDIX G
Contour Map Reporting Form

This reporting form shall accompany each ground water contour map submittal. Use additional sheets as necessary.

Figure 4-1

1. Did any surveyed well casing elevations change from the previous sampling event? Yes___ No_X_. If yes, attach new "Well Certification - Form B – Location Certification" as found in the "Guide for the Submission of Remedial Action Workplans" (NJDEP, March 1995) and identify the reason for the elevation change (damage to casing, installation of recovery system in monitoring well, etc.).

2. Are there any monitor wells in unconfined aquifers in which the water table elevation is higher than the top of the well screen? Yes___ No_X_. If yes, identify these wells.

3. Are there any monitor wells present at the site but omitted from the contour map? Yes___ No_X_. Unless the omission of the well(s) has been previously approved by the Department, justify the omissions.

4. Are there any monitor wells containing separate phase product during this measuring event? Yes___ No_X_. Were any of the monitor wells with separate phase product included in the ground water contour map? Yes___ No_X_. If yes, show the formula used to correct the water table elevation.

NOTICE: This is a courtesy copy of this rule adoption. The official version of this rule was published in the July 5, 2005 *New Jersey Register*. Should there be any discrepancy between this text and the official version of the proposal, the official version will govern. For more information see the New Jersey Office of Administrative Law Rules page at http://www.nj.gov/oal/rules.html.

5. Has the ground water flow direction changed more than 45 degrees from the previous ground water contour map? Yes___ No_X_. If yes, discuss the reasons for the change.

6. Has ground water mounding and/or depressions been identified in the ground water contour map? Yes___ No_X_. Unless the ground water mounds and/or depressions are caused by the ground water remediation system, discuss the reasons for this occurrence.

7. Are all the wells used in the contour map screened in the same water-bearing zone? Yes_X_ No___. If no, justify inclusion of those wells.

8. Were the ground water contours computer generated___, computer aided_X_, or hand-drawn___? If computer aided or generated, identify the interpolation method(s) used.

APPENDIX G
Contour Map Reporting Form

This reporting form shall accompany each ground water contour map submittal. Use additional sheets as necessary.

Figure 4-4

1. Did any surveyed well casing elevations change from the previous sampling event? Yes___ No_X_. If yes, attach new "Well Certification - Form B – Location Certification" as found in the "Guide for the Submission of Remedial Action Workplans" (NJDEP, March 1995) and identify the reason for the elevation change (damage to casing, installation of recovery system in monitoring well, etc.).

2. Are there any monitor wells in unconfined aquifers in which the water table elevation is higher than the top of the well screen? Yes___ No_X_. If yes, identify these wells.

3. Are there any monitor wells present at the site but omitted from the contour map? Yes___ No_X_. Unless the omission of the well(s) has been previously approved by the Department, justify the omissions.

4. Are there any monitor wells containing separate phase product during this measuring event? Yes___ No_X_. Were any of the monitor wells with separate phase product included in the ground water contour map? Yes___ No_X_. If yes, show the formula used to correct the water table elevation.

NOTICE: This is a courtesy copy of this rule adoption. The official version of this rule was published in the July 5, 2005 *New Jersey Register*. Should there be any discrepancy between this text and the official version of the proposal, the official version will govern. For more information see the New Jersey Office of Administrative Law Rules page at http://www.nj.gov/oal/rules.html.

5. Has the ground water flow direction changed more than 45 degrees from the previous ground water contour map? Yes___ No_X_. If yes, discuss the reasons for the change.

6. Has ground water mounding and/or depressions been identified in the ground water contour map? Yes___ No_X_. Unless the ground water mounds and/or depressions are caused by the ground water remediation system, discuss the reasons for this occurrence.

7. Are all the wells used in the contour map screened in the same water-bearing zone? Yes_X_ No___. If no, justify inclusion of those wells.

8. Were the ground water contours computer generated___, computer aided_X_, or hand-drawn___? If computer aided or generated, identify the interpolation method(s) used.

Notes: VOCs = volatile organic compounds; SVOCs = semi-volatile organic compounds; Historical Data for rounds 1 through 10 derived from previous RAPR
PCBs = polychlorinated biphenyls; NLE= No Limit Established.
ND = Not Detected; ug/L = micrograms per liter, equivalent to parts per billion (ppb); NA = Not Analyzed/Not Applicable;
Shaded block identifies sample and associated constituent concentration that exceeds the criterion.
Criterion = GW Criterion: NJDEP Groundwater Quality Criteria (Higher of GWQC and PQL) per N.J.A.C. 7:9-6.

PCBs = polychlorinated biphenyls; NLE= No Limit Established.
ND = Not Detected; ug/L = micrograms per liter, equivalent to parts per billion (ppb); NA = Not Analyzed/Not Applicable Shaded block identifies sample and associated constituent concentration that exceeds the criterion.
Criterion = GW Criterion: NJDEP Groundwater Quality Criteria (Higher of GWQC and PQL) per N.J.A.C. 7:9-6.

Material Safety Data Sheet for Hydrogen Release Compound®

MATERIAL SAFETY DATA SHEET

Last Revised: March 1, 2001

****

Section 1 - Material Identification

****

Supplier: Regenesis Bioremediation Products
1011 Calle Sombra
San Clemente, CA 92673
Telephone: (949) 366-8000
Facsimile: (949) 366-8090

Chemical Name: Propanoic acid, 2-[2-[2-(2-hydroxy-1-oxopropoxy)-1-oxopropoxy]

-1-oxopropoxy]-1,2,3-propanetriyl ester

Chemical Family: Organic Chemical

Trade Name: Glycerol tripolylactate

Product Name: Hydrogen Release Compound® (HRC®)

****

Section 2 - Hazardous Ingredients

****

CAS #: 201167-72-8

One should anticipate the potential for eye irritation and skin irritation with large scale exposure or in sensitive individuals.

****

Section 3 - Physical Data

****

Melting Point: NA

Boiling Point: ND

Flash Point: ND

Density: 1.347

Solubility: Acetone and DMSO

Appearance: Amber semi-solid

Odor: Not detectable

Vapor Pressure: None

****

Section 4 - Fire and Explosion Hazard Data

****

Extinguishing Media: Carbon Dioxide, Dry Chemical Powder or Appropriate Foam.

Water may be used to keep exposed containers cool.

For large quantities involved in a fire, one should wear full protective clothing and a NIOSH approved self contained breathing apparatus with full face piece operated in the pressure demand or positive pressure mode as for a situation where lack of oxygen and excess heat are present.

****

Section 5 - Toxicological Information

****

Acute Effects: May be harmful by inhalation, ingestion, or skin absorption.

May cause irritation. To the best of our knowledge, the chemical, physical, and toxicological properties of the glycerol tripolylactate have not been investigated. Listed below are the toxicological information for glycerol and lactic acid.

RTECS#: MA8050000

Glycerol

Irritation data: SKN-RBT 500 MG/24H MLD 85JCAE-,207,1986

EYE-RBT 126 MG MLD BIOFX* 9-4/1970

EYE-RBT 500 MG/24H MLD 85JCAE-,207,1986

Toxicity data: ORL-MUS LD50:4090 MG/KG FRZKAP (6),56,1977

SCU-RBT LD50:100 MG/KG NIIRDN 6,215,1982

ORL-RAT LD50:12600 MG/KG FEPRA7 4,142,1945

IHL-RAT LC50: >570 MG/M3/1H BIOFX* 9-4/1970

IPR-RAT LD50: 4420 MG/KG RCOCB8 56,125,1987

IVN-RAT LD50:5566 MG/KG ARZNAD 26,1581,1976

IPR-MUS LD50: 8700 MG/KG ARZNAD 26,1579,1978

SCU-MUS LD50:91 MG/KG NIIRDN 6,215,1982

IVN-MUS LD50: 4250 MG/KG JAPMA8 39,583,1950

ORL-RBT LD50: 27 GM/KG DMDJAP 31,276,1959

SKN-RBT LD50:>10GM/KG BIOFX* 9-4/1970

IVN-RBT LD50: 53 GM/KG NIIRDN 6,215,1982

ORL-GPG LD50: 7750 MG/KG JIHTAB 23,259,1941

Target Organ data: Behavioral (headache), gastrointestinal (nausea or vomiting), Paternal effects (spermatogenesis, testes, epididymis, sperm duct), effects of fertility (male fertility index, post-implantation mortality).

RTECS#: OD2800000

Lactic acid

Irritation data: SKN-RBT 5MG/24H SEV 85JCAE -,656,86

EYE-RBT 750 UG SEV AJOPAA 29,1363,46

Toxicity data: ORL-RAT LD50:3543 MG/KG FMCHA2-,C252,91

SKN-RBT LD50:>2 GM/KG FMCHA2-,C252,91

ORL-MUS LD50: 4875 MG/KG FAONAU 40,144,67

ORL-GPG LD50: 1810 MG/KG JIHTAB 23,259,41

ORL-QAL LD50: >2250 MG/KG FMCHA2-,C252,91

Only selected registry of toxic effects of chemical substances (RTECS) data is presented here. See actual entry in RTECS for complete information on lactic acid and glycerol.

****

Section 6 - Health Hazard Data

****

Handling: Avoid continued contact with skin.

Avoid contact with eyes.

In any case of any exposure which elicits a response, a physician should be consulted immediately.

First Aid Procedures:

Inhalation: Remove to fresh air. If not breathing give artificial respiration. In case of labored breathing give oxygen. Call a physician.

Ingestion: No effects expected. Do not give anything to an unconscious person. Call a physician immediately.

Skin Contact: Flush with plenty of water. Contaminated clothing may be washed or dry cleaned normally.

Eye contact: Wash eyes with plenty of water for at least 15 minutes lifting both upper and lower lids. Call a physician.

****

Section 7 - Reactivity Data

****

Conditions to Avoid: Strong oxidizing agents, bases and acids

Hazardous Polymerization: None known

Further Information: Hydrolyses in water to form Lactic Acid and Glycerol.

****

Section 8 - Spill, Leak or Accident Procedures

****

After Spillage or Leakage: Neutralization is not required. This combustible material may be burned in a chemical incinerator equipped with an afterburner and scrubber.

Disposal: Laws and regulations for disposal vary widely by locality. Observe all applicable regulations and laws. This material, may be disposed of in solid waste. Material is readily degradable and hydrolyses in several hours.

No requirement for a reportable quantity (CERCLA) of a spill is known.

****

Section 9 - Special Protection or Handling

****

Should be stored in plastic lined steel, plastic, glass, aluminum, stainless steel, or reinforced fiberglass containers.

Protective Gloves: Vinyl or Rubber

Eyes: Splash Goggles or Full Face Shield

Area should have approved means of washing

eyes.

Ventilation: General exhaust.

Storage: Store in cool, dry, ventilated area.

Protect from imcompatible materials.

****

Section 10 - Other Information

****

This material will degrade in the environment by hydrolysis to lactic acid and glycerol.

Materials containing reactive chemicals should be used only by personnel with appropriate chemical training.

The information contained in this document is the best available to the supplier as of the time of writing. Some possible hazards have been determined by analogy to similar classes of material. No separate tests have been performed on the toxicity of this material. The items in this document are subject to change and clarification as more information becomes available.

Greg,

This is a standard progress report with results indicating steady decreasing contaminants of concern at the site. Subsequent reports are being prepared.

EXECUTIVE SUMMARY

A Hydrogen Release Compound® (HRC®) injection program was implemented to remediate tetrachloroethene (PCE) identified in shallow groundwater at the M-5 Landfill site, Main Post, Fort Monmouth, New Jersey. The application of anaerobic bioremediation was conducted in accordance with the M-5 Landfill site Remedial Investigation Report (RIR)/Remedial Action Work Plan (RAWP), prepared by ATC Associates, Inc. (ATC), dated February 2000. The HRC® direct injection program involved seven distinct areas in and around the M-5 Landfill site, where elevated concentrations of PCE were detected in the shallow groundwater. This Remedial Action Progress Report (RAPR) documents groundwater quality conditions over time and evaluates the impact of the HRC® injection program undertaken from September 2002 through August 2003.

A general decreasing trend of PCE concentrations in groundwater was observed at the site throughout the period of groundwater sampling (4th Quarter 2002 through 3rd Quarter 2003). Similarly, concentrations of trichloroethene (TCE) and cis-1,2-dichloroethene (cis-1,2-DCE) were detected in groundwater during several sampling rounds at more than one monitoring well location. This evidence of an increase in daughter (i.e., breakdown) products supports the contention that PCE degradation is occurring at the M-5 Landfill site, presumably due to the effectiveness of the HRC® to support the degradation processes.

Based on the observed decreasing trend of PCE concentrations and the increased presence of degradation products in the groundwater, the HRC® subsurface injection program will continue. Remedial action progress will be monitored and reported to the New Jersey Department of Environmental Protection (NJDEP) periodically.

1.0 INTRODUCTION

VERSAR, Inc. (Versar) was contracted by the United States (U.S.) Army Garrison, Fort Monmouth (Fort Monmouth), Directorate of Public Works (DPW), Fort Monmouth, New Jersey to prepare an RAPR to document the activities performed for the remediation of PCE in the shallow groundwater at the M-5 Landfill site located at Fort Monmouth. The application of a HRC® injection program to remediate PCE was conducted in accordance with the M-5 Landfill site RIR/RAWP, prepared by ATC, dated February 2000 and approved by the NJDEP in March 2001. This report includes all information contained in the RIR/RAWP and describes the effectiveness of the remedial activities performed by the DPW as of August 2003.

1.1 Objectives

The objective of this RAPR is to document the implementation of the remedial action program performed at the M-5 Landfill site during the reporting period of 4th Quarter 2002 through 3rd Quarter 2003. The purpose of the remedial action was to treat the PCE affected areas through use of HRC® and thereby reduce PCE concentrations to comply with the NJDEP Class II-A Groundwater Quality Criteria (GWQC). The remedial activities were conducted in accordance with NJDEP *Technical Requirements for Site Remediation* (July 1999), NJAC 7:26E, et seq.

The remedial action and subsequent preparation of the RAPR encompassed the following:

- Applying HRC® treatment to seven zones within the M-5 Landfill site area where the highest groundwater impacts were observed/documented.
- Conducting quarterly rounds of groundwater and surface water sampling to evaluate effectiveness of the remedial action.
- Comparison of the results of the groundwater and surface water quality monitoring programs with the NJDEP GWQC and Surface Water Quality Standards (SWQS).
- Identifying and discussing recommendations for the continuation of this remedial action.
- Documenting all remedial activities as required by the NJDEP *Technical Requirements for Site Remediation* NJAC 7:26E et seq.

1.2 Report Organization

This report is organized to minimize repetition. **Section 2.0** provides background information on the activities performed at the M-5 Landfill site. **Section 3.0** describes and summarizes the remedial activities (HRC® injection) conducted at the M-5 Landfill site, including groundwater and surface water sampling. **Section 4.0** discusses groundwater flow at the M-5 Landfill site. **Section 5.0** presents the chemical results of the groundwater and surface water sampling. **Section 6.0** discusses the progress of the remedial action and provides recommendations for the M-5 Landfill site.

2.0 SITE BACKGROUND

The following sections describe the site background of the M-5 Landfill site. Included is a description of the site location, site history and background investigations.

2.1 Site Location and Description

The M-5 Landfill site is located on the western portion of the Main Post, just west of the Eatontown/Oceanport Borough line (**Figure 2-1**). The site is located on the northwest corner of the intersection of North Drive and Wilson Avenue, and is bordered by Mill Creek and Parkers Creek to the west (**Figure 2-2**). The approximate area of the M-5 Landfill is 138,200 ft^2 (3.2 acres). The M-5 Landfill was constructed in a former swamp and was reportedly used for the disposal of automobiles as well as for domestic and industrial wastes (Weston, 1995). The environmental setting (regional/local geology and hydrogeology) of the M-5 Landfill site is described in the ATC RIR/RAWP, dated February 2000 (**Appendix A**).

2.2 Site History and Background Investigations

The U.S. Army Corps of Engineers (USACE), Baltimore District, initially contracted Weston to perform a field investigation at Fort Monmouth, New Jersey. Suspected hazardous waste sites were initially identified at Fort Monmouth in a report prepared by the U.S. Army Toxic and Hazardous Materials Agency (USATHAMA, 1980). The USATHAMA report identified 37 sites with known or suspected waste materials on the Main Post and the two subposts (Charles Wood and Evans Area). Roy F. Weston, Inc. (Weston) conducted a background investigation of the 37 sites, as well as eight additional sites that were identified by Fort Monmouth and the NJDEP. Weston's findings were described in a report titled, *Investigation of Suspected Hazardous Waste Sites at Fort Monmouth, New Jersey* (1993).

As part of a NJPDES permit, surface-water samples have been collected at two locations (one upstream on Mill Creek and one downstream on Lafetra Creek) since February 1986. The results indicated that one volatile organic compound (VOC), PCE, was detected at concentrations exceeding the NJDEP SWQS (Weston, 1995). In the background report, additional investigations (including sampling and other field work) were recommended at 22 of the sites on the Main Post and Charles Wood areas, including the M-5 Landfill site. NJDEP approved the recommendations on April 20, 1995.

The 1995 Weston Site Investigation (SI) Report presents the results of field investigation activities that were performed at 13 sites at the Main Post Area and eight sites at the Charles Wood Area. The results of the investigation of the M-5 Landfill site are included in the Weston SI report. Initial field investigation activities were performed between November 1994 and November 1995. The field investigation activities included surface geophysical investigations, sediment and surface water sampling, transformer site sampling, surface and subsurface soil sampling, groundwater monitoring well installation and sampling, and tidal monitoring. The Weston SI report was used as the basis for

subsequent remedial investigations at the Main Post and Charles Wood areas, which progressed to the development of remedial actions, including the remediation program at the M-5 Landfill site.

2.2.1 Site Investigation Report - Weston

In February 1995, Weston, as part of an SI of the M-5 Landfill site, conducted a surface geophysical investigation and a hydrogeologic interpretation of the fill site. Shallow monitoring wells, M5-MW10 (downgradient) and M5-MW11 (upgradient), were installed at strategic locations to monitor groundwater in the area. The monitoring wells were sampled twice for Target Compound List (TCL) plus 30 parameters (TCL+30), semi-volatile organic compounds (SVOCs), and Target Analyte List (TAL) metals, sulfate and cyanide.

Groundwater quality data for the two monitoring wells indicated that PCE exceeded the NJDEP GWQC in M5-MW11, the upgradient well, in both sampling rounds. There were no exceedences of the NJDEP GWQC for SVOCs, sulfate or cyanide. Four metals (aluminum, iron, manganese and sodium) were identified at concentrations exceeding the NJDEP GWQC.

The Weston SI Report also presented a DPW proposal for the M-5 Landfill site that was subsequently implemented. A long-term groundwater and surface water monitoring program was developed utilizing the existing monitoring wells and supplemental wells installed during follow-up investigations, as well as surface water sampling locations, to document and monitor surface water and groundwater quality over time.

2.2.2 Remedial Investigation/Remedial Action Work Plan - ATC

In April 1995, the DPW began its remedial investigation (RI) of the M-5 Landfill site at Fort Monmouth, Main Post. The purpose of this investigation was to collect samples to evaluate the soil, groundwater and surface water quality at and in the vicinity of the M-5 Landfill site, and to prepare a RAWP (**Appendix A**) to address the need for remediation of these media, if necessary. ATC was contracted by the DPW to evaluate the data collected during the remedial investigation.

The RI involved drilling and sampling 261 Geoprobe® locations for soil and groundwater, installing 12 new shallow groundwater monitoring wells (see Appendix B and Appendix D of the ATC RIR/RAWP presented in **Appendix A**), drilling three deep soil borings, and sampling two groundwater monitoring wells during 11 quarterly sampling events, three groundwater monitoring wells for six quarterly sampling events, and ten groundwater monitoring wells for three quarterly sampling events (see Tables 1 through 18 of the ATC RIR/RAWP presented in **Appendix A**). The results of this investigation indicate that the shallow groundwater contained VOCs, particularly PCE, which exceeded the NJDEP GWQC. Analytical results indicated that PCE concentrations in soil borings at the M-5 Landfill site were only marginally above NJDEP Impact to Groundwater Soil Cleanup Criteria (IGWSCC). The end result of the

RI identified PCE as a Contaminant of Concern (COC) in groundwater at the M-5 Landfill site.

The moderate concentrations and areal distribution of PCE in the soil and groundwater at the M-5 Landfill site suggest that this location is suitable for a bioremediation program. In general, PCE concentrations are expected to come into compliance with the NJDEP Class II GWQC within a five-year period. Although PCE concentrations are expected to naturally attenuate to acceptable levels, the DPW wishes to shorten the time required for compliance with the GWQC. Therefore, the DPW proposes to actively remediate existing concentrations of PCE by treating the affected areas with HRC®. The DPW proposed to treat seven PCE-affected areas with a specific HRC® application protocol. A groundwater sampling program was designed to measure the effectiveness of the HRC® treatment program and to monitor COC concentrations in groundwater (discussed further in **Section 3.0**). The RIR/RAWP was submitted by ATC in February 2000 and approved by the NJDEP in March 2001.

2.2.3 Remedial Investigation Report for Near-Surface Soils - Versar

Versar performed an RI for the M-5 Landfill site which included the 1995 Weston findings as well as data from recent surface soil sampling performed by the DPW. Sampling of the near surface soils was performed by the DPW to demonstrate compliance equivalence with respect to the Solid Waste Disposal Act of 1965. To characterize the near-surface soils, which cover the M-5 Landfill site, the DPW obtained samples from the top 2 feet of soil at 173 locations throughout the site, from April through August 1998. The sampling data did not identify a significant prevalent source of contamination exceeding the NJDEP Residential Direct Contact Soil Cleanup Criteria (RDCSCC). Only minor localized exceedences were identified after compliance averaging. Evaluation of the concentrations of organic and inorganic soil contaminants indicated that the site does not pose a risk from direct contact with surface and near-surface soils. No Further Action was recommended regarding the surface and near-surface soils throughout the M-5 Landfill site. These findings are described in detail in Versar's Remedial Investigation Report for Near-Surface Soils (March 2004).

2.2.4 Remedial Action Progress Report – Versar

After the first HRC® application to Site 812 and nine subsequent rounds of groundwater monitoring well sampling (3rd Quarter 2000 through 3rd Quarter 2002), an RAPR was prepared by Versar, dated December 2003. The RAPR documented the groundwater quality conditions over time and evaluated the impact of the HRC® injection program.

The initial injection of HRC® was performed by DPW using a GeoProbe® from September 2000 through December 2000 under the provisions of the NJDEP Permit-by-Rule program. The second injection of HRC® was performed by DPW from February 2002 through September 2002, also under the provisions of the NJDEP Permit-by-Rule program.

A decreasing trend of PCE concentrations in groundwater was observed at the site throughout the period of groundwater sampling. Similarly, concentrations of trichloroethene (TCE) and cis-1,2-dichloroethene (cis-1,2-DCE) were detected in groundwater during several sampling rounds at more than one monitoring well location. This evidence of an increase in daughter (e.g., breakdown) products supports the contention that PCE degradation is occurring at the M-5 Landfill site, presumably due to the effectiveness of the HRC® to support the degradation processes.

Based on the observed decreasing trend of PCE concentrations and the increased presence of degradation products in the groundwater, the HRC® subsurface injection program was continued.

3.0 REMEDIAL ACTIVITIES

In the RIR/RAWP for the M-5 Landfill site (ATC, 2000), sampling results indicated that the shallow groundwater contained PCE concentrations in excess of the NJDEP GWQC. Although PCE concentrations in groundwater are expected to gradually decrease through natural attenuation, the DPW implemented an anaerobic bioremediation program to actively address the PCE groundwater contamination at the M-5 Landfill site. This anaerobic bioremediation involved treatment of seven areas of chlorinated hydrocarbon contamination with HRC®.

3.1 Hydrogen Release Compound® Injections

HRC® is a slow-release compound that provides a steady hydrogen source for between six months and one year, and has been shown to enhance the natural attenuation of PCE at study sites. HRC® is a proprietary, food quality, polylactate ester that, upon being deposited into the subsurface, creates anaerobic aquifer conditions and causes the release of hydrogen. Under anaerobic conditions, naturally occurring microorganisms use the hydrogen to progressively remove chlorine atoms from chlorinated hydrocarbons via reductive dechlorination.

The third HRC® injection for the remediation of the COC at the M-5 Landfill site used the methodology as described in the RAWP prepared by ATC, dated February 2000 (**Appendix A**) and was performed from June 2003 through August 2003. This HRC® direct injection program included seven distinct areas in and around the M-5 Landfill site, where elevated concentrations of PCE were detected in the shallow groundwater. These seven HRC® injection areas (HRC-1 through HRC-7) are illustrated in **Figure 3-1**. Placement of the treatment areas was intended to provide direct treatment of the areas of highest groundwater impact. The injection points were located within a 12 foot by 12 foot grid over each of the seven treatment areas. The injections were applied at a rate of 4 pounds per vertical foot using direct push technology through 1.25-inch (outer diameter) Geoprobe® rods to a depth approximately 15 feet below ground surface (bgs). After completion of each injection point, a high-pressure pump was used to inject the HRC® compounds from bottom to top. Approximately 8,670 pounds of HRC® was injected into the subsurface at the M-5 Landfill site during the third injection event.

Subsequent injections will be conducted periodically to achieve an overall reduction of PCE concentrations to below the NJDEP GWQC of 1.0 ug/L.

3.2 Discharge to Groundwater Permit

The purpose of the NJPDES DGW permit is to request formal approval of the HRC® subsurface injection program at the M-5 Landfill site as described in the RAWP prepared by ATC (**Appendix A**). The third injection (June-Aug 2003) was completed with the prior approval of the NJDEP under the provisions of a Permit by Rule agreement. VERSAR prepared the DGW permit application package in November 2001, which was subsequently presented to the NJDEP for approval.

As described in the ATC RAWP, the HRC® injections will not result in the discharge of any hazardous compounds. Because there is no influent or effluent associated with the injection of HRC® to groundwater, the HRC® and clean tap water are the only substances that will be injected into the aquifer. A Material Data Safety Sheet (MSDS) for the HRC® is presented in **Appendix B**.

4.0 MONITORING AND SAMPLING ACTIVITIES

As part of the approved RIR/RAWP implementation which consists of HRC® injection and evaluation, and a Long Term Monitoring (LTM) program, quarterly groundwater and surface water sampling was performed by DPW's base operations contractor, TECOM-Vinnell Sevices, Inc. (TVS) from 4th Quarter 2002 through 3rd Quarter 2003. Sampling activities were performed in accordance with the *Fort Monmouth Standard Sampling Operating Procedure* (December 1997). Laboratory analyses of the samples collected at the M-5 Landfill site were conducted at the Fort Monmouth Environmental Testing Laboratory (FMETL), a New Jersey certified laboratory (Certification No. 13461).

4.1 Groundwater Monitoring

During the groundwater sampling program at the M-5 Landfill site (four quarterly rounds from 4th Quarter 2002 through 3rd Quarter 2003), groundwater was encountered in the 12 monitoring wells at the M-5 Landfill site at depths ranging from 2.03 to 11.73 feet bgs (**Table 4-1**) with a varying gradient toward the southwest.

To determine if groundwater flow conditions have changed since the onset of remedial actions regarding groundwater contamination at the M-5 Landfill site, four groundwater elevation contour maps were generated based on groundwater depth measurements collected from 12 monitoring wells at the M-5 Landfill (wells M5-MW10, M5-MW11, M5-MW12, M5-MW13, M5-MW14, M5-MW15, M5-MW16, M5-MW18, M5-MW19, M5-MW20, M5-MW23, and M5-MW25). These contour maps (**Figure 4-1** through **Figure 4-4**) were constructed using static depth to water measurements (**Table 4-1**) observed within the same day.

The groundwater underlying the M-5 Landfill site consistently flows to the southwest towards Parkers Creek at elevations ranging from 2.32 to 10.13 feet above mean sea level (amsl) with site gradients ranging from 0.0095 feet per foot on January 22, 2003 and April 21, 2003 to 0.0131 feet per foot on October 28, 2002. No significant variations in groundwater flow conditions were observed in these four groundwater contour maps.

4.2 Groundwater Sampling

Quarterly groundwater sampling was performed by the DPW at the M-5 Landfill site from 4th Quarter 2002 through 3rd Quarter 2003 as part of the ongoing groundwater monitoring and sampling program approved by the NJDEP. Groundwater samples were collected from 12 monitoring wells (M5-MW10, M5-MW11, M5-MW12, M5-MW13, M5-MW14, M5-MW15, M5-MW16, M5-MW18, M5-MW19, M5-MW20, M5-MW23 and M5-MW25) during four quarterly sampling events performed during the last reporting period.

A total of 48 groundwater samples were collected using protocols as described in the *New Jersey DEP Field Sampling Procedures Manual* (1992). The samples were analyzed for

VOCs plus 15 tentatively identified compounds (TICs), SVOCs plus 15 TICs, pesticides, polychlorinated biphenyls (PCBs) and TAL metals.

Sampling equipment was thoroughly decontaminated before and after each use, in accordance with the *Fort Monmouth Standard Sampling Operating Procedure* (1997). Following collection, the groundwater samples were immediately placed in laboratory-supplied bottleware. The sample containers were labeled, sealed, packed in ice and transported to the FMETL under proper chain-of-custody procedures.

Copies of the chain-of-custody forms for the laboratory analyses and laboratory data sheets are presented in **Appendix C**. A summary of the groundwater sampling activities, including rounds, well IDs, sample IDs, sample locations, collection/analysis date, analytical parameters and analysis method, is provided in **Table 4-2**. **Figure 2-2** shows the locations of the monitoring wells at the M-5 Landfill site. The results of these analyses are discussed in **Section 5.1**.

4.3 Surface Water Sampling

Surface water sampling was conducted by the DPW from 4th Quarter 2002 through 3rd Quarter 2003. A total of 16 surface water samples were collected over four rounds of sampling from four distinct surface water sample collection points (SS-4, SS-5, SS-15 and SS-16). **Figure 2-2** shows the locations of the surface water sample collection points at the M-5 Landfill site. The samples were analyzed by FMETL for VOCs plus 15 TICs, pesticides and PCBs. The results of these analyses are discussed in **Section 5.2**.

Sampling equipment was thoroughly decontaminated before and after each use, in accordance with the *Fort Monmouth Standard Sampling Operating Procedure* (1997). The surface water samples were collected and immediately placed in laboratory-supplied bottleware. The sample containers were labeled, sealed, packed in ice and transported to the FMETL under proper chain-of-custody procedures.

Copies of the chain-of-custody forms and the laboratory analyses are presented in **Appendix D**. A summary of the surface water sampling activities, including rounds, sample IDs, stream sampling locations, collection/analysis date, analytical parameters and analysis method is provided in **Table 4-3**.

5.0 SITE CHEMICAL RESULTS

This section includes a summary discussion of the chemical characterization of the site based on the various samples collected and analyzed, including four quarterly rounds of monitoring well samples and four rounds of surface water samples. Sample analyses were performed by the FMETL.

5.1 Groundwater Sampling Results

A total of 48 quarterly groundwater samples were collected to evaluate the effectiveness of the HRC injection and LTM program with respect to PCE contamination at the M-5 Landfill site. The laboratory analytical results for each monitoring well are summarized in **Table 5-1** through **Table 5-12**. This section presents a summary of the laboratory results performed for the four rounds of groundwater samples collected from 4th Quarter 2002 through 3rd Quarter 2003. Groundwater samples were collected from the 12 monitoring wells (M5-MW10, M5-MW11, M5-MW12, M5-MW13, M5-MW14, M5-MW15, M5-MW16, M5-MW18, M5-MW19, M5-MW20, M5-MW23 and M5-MW25) at the M-5 Landfill site. The groundwater samples were collected and analyzed for VOCs plus 15 TICs, SVOCs plus 15 TICs, pesticides, PCBs and TAL metals.

Analytes detected in groundwater samples at concentrations above the NJDEP GWQC are highlighted **Table 5-1** through **Table 5-12**. The laboratory chain of custody forms and laboratory data sheets for groundwater samples are provided in **Appendix C**. Historical groundwater monitoring well sampling results, conducted between May 1997 and September 1999, are presented in Table 3 through Table 17 in the ATC RAWP in **Appendix A**. **Figure 5-1** shows the groundwater contaminant distribution of the current data within the area of the M-5 Landfill site, including the historical groundwater sampling results.

During four quarterly sampling events conducted from 4th Quarter 2002 through 3rd Quarter 2003, a total of six VOCs were detected in site groundwater. Three VOCs were detected at concentrations that exceed the respective GWQC in at least one sample, while the remaining three VOCs were detected below the respective GWQC. A total of two SVOCs were detected in site groundwater at concentrations below the respective GWQC. No pesticides or PCBs were detected in site groundwater. A total of 20 metals were detected in site groundwater. Seven metals were detected at concentrations that exceed the respective GWQC in at least one sample, while the remaining 13 metals were detected below the respective GWQC. A groundwater exceedence summary is presented in **Table 5-13**.

The following sections present the analytes detected above the GWQC found in the groundwater at the M-5 Landfill site.

5.1.1 Contaminant of Concern

Based on the ATC RIR/RAWP (2000), PCE is considered to be the only COC at the M-5 Landfill site. **Figure 5-2** through **Figure 5-7** present the trend of PCE concentrations detected in groundwater monitoring wells M5-MW11, M5-MW16, M5-MW18, M5-MW19, M5-MW20 and M5-MW23 over time. PCE was not detected in the remaining monitoring wells. The following paragraphs present the results of the COC, PCE, and its daughter products [trichloroethene (TCE) and cis-1,2-dichloroethene (cis-1,2-DCE)] detected above the GWQC found in the groundwater at the M-5 Landfill site. **Section 6.0** presents the discussion of the PCE trend occurring in relation to the progress of the HRC remediation program at the M-5 Landfill site.

PCE was detected at concentrations above the GWQC of 1.0 ug/L during four separate rounds of sampling collected from five separate monitoring well locations. Concentrations ranged from 1.01 ug/L in M5-MW19 (sampling round #17) to 79.46 ug/L in M5-MW23 (sampling round #15).

TCE was detected at concentrations exceeding the GWQC of 1.0 ug/L during four separate rounds of sampling collected at three separate monitoring well locations. Concentrations ranged from 1.06 ug/L in M5-MW11 (sampling round #15) to 5.61 ug/L in M5-MW16 (sampling round #17).

cis-1,2-DCE was detected at concentrations exceeding the GWQC of 10 ug/L during four separate rounds of sampling collected at one monitoring well location (M5-MW16). Concentrations ranged from 16.12 ug/L (sampling round #16) to 103.82 ug/L (sampling round #14).

5.1.2 Remaining Analyte Exceedences

The remaining contaminants, detected above the GWQC, occur at low to moderate concentrations in a limited number of groundwater monitoring well samples collected during this reporting period. **Sections 5.1.2.1** through **5.1.2.4** summarize these results.

5.1.2.1 Volatile Organic Compounds

No other VOCs were detected above the appropriate GWQC at the site.

5.1.2.2 Semi-Volatile OrganicCompounds

No SVOCs were detected above the appropriate GWQC at the site.

5.1.2.3 Pesticides and PCBs

No pesticides or PCBs were detected above the appropriate GWQC at the site.

5.1.2.4 TAL Metals

During four quarterly sampling events conducted from 4th Quarter 2002 through 3rd Quarter 2003, a total of seven metals (aluminum, arsenic, barium, cadmium, iron, manganese and sodium) were detected in site groundwater at concentrations that exceed the respective GWQC in at least one sample.

Aluminum was detected at concentrations exceeding the GWQC of 200 ug/L during four separate rounds of sampling collected at ten separate monitoring well locations. Concentrations ranged from 202 ug/L in M5-MW11 (sampling round #15) to 6,920 ug/L in M5-MW23 (sampling round #15).

Arsenic was detected at concentrations exceeding the GWQC of 8.0 ug/L during four separate rounds of sampling collected at four separate monitoring well locations. Concentrations ranged from 8.1 ug/L in M5-MW19 (sampling round #14) to 86.7 ug/L in M5-MW23 (sampling round #15).

Barium was detected at concentrations exceeding the GWQC of 2,000 ug/L during one round of sampling collected at one monitoring well location at a concentration of 4,490 ug/L in M5-MW18 (sampling round #16).

Cadmium was detected at concentrations exceeding the GWQC of 4.0 ug/L during two separate rounds of sampling collected at two separate monitoring well locations. Concentrations ranged from 8.11 ug/L in M5-MW23 (sampling round #15) to 11.4 ug/L in M5-MW18 (sampling round #16).

Iron was detected at concentrations exceeding the GWQC of 300 ug/L during four separate rounds of sampling collected at 12 separate monitoring well locations. Concentrations ranged from 586 ug/L in M5-MW15 (sampling round #16) to 204,000 ug/L in M5-MW18 (sampling round #16).

Manganese was detected at concentrations exceeding the GWQC of 50 ug/L during four separate rounds of sampling collected at nine separate monitoring well locations. Concentrations ranged from 53.7 ug/L in M5-MW18 (sampling round #14) to 1,060 ug/L in M5-MW10 (sampling round #16).

Sodium was detected at concentrations exceeding the GWQC of 50,000 ug/L during four separate rounds of sampling collected at seven separate monitoring well locations. Concentrations ranged from 53,500 ug/L in M5-MW12 (sampling round #15) to 149,000 ug/L in M5-MW25 (sampling round #17).

5.2 Surface Water Sampling Results

A total of 16 quarterly surface water samples were collected by DPW to determine if PCE identified in groundwater has impacted the surface water quality at the M-5 Landfill site. The laboratory analytical results for each surface water site are summarized in

Table 5-14 through **Table 5-17**. This section presents a summary of the laboratory results performed for the four rounds of sampling collected from 4th Quarter 2002 through 3rd Quarter 2003. Surface water samples were collected from four distinct surface water sample collection points (SS-4, SS-5, SS-15 and SS-16) which are in proximity to the M-5 Landfill site. The surface water samples were collected and analyzed for VOC plus 15 TICs, pesticides and PCBs.

The stream sampling results were compared to the NJDEP SWQS. Analytes detected above the respective NJDEP SWQS are highlighted in **Table 5-14** through **Table 5-17**. Historical surface water stream sampling results, conducted between October 1996 and June 1999, are presented in Table 18 of the ATC RAWP in **Appendix A**. **Figure 5-1** shows the surface water stream sites contaminant distribution of the current data within the area of the M-5 Landfill site, including the historical surface water sampling results. The laboratory chain of custody forms for surface water samples are provided in **Appendix D**.

During four quarterly sampling events conducted from 4th Quarter 2002 through 3rd Quarter 2003, a total of three VOCs were detected in site surface water at concentrations below their respective SWQS. No pesticides or PCBs were detected in site surface water.

5.3 Quality Assurance/Quality Control (QA/QC)

In order to verify the reliability of the analytical results, Versar reviewed the holding times for each sample and the results of the analysis of seven method blanks for VOCs, four method blanks for SVOCs, four method blanks for pesticides and PCBs, four method blanks for TAL metals, four trip blanks, four field blanks, and four field duplicate samples. All samples were analyzed by the FMETL within the prescribed holding time requirements for each analytical method.

Method Blanks

Laboratory method blanks accompanied each batch of samples for the M-5 Landfill site. These method blanks consist of laboratory grade water that is processed identically to the samples and analyzed with the sample batch. A total of seven method blanks for VOCs, four method blanks for SVOCs, four method blanks for pesticides and PCBs and four method blanks for TAL metals were analyzed with the M-5 Landfill site samples.

No VOCs, SVOCs, pesticides or PCBs were detected in any method blank samples.

Several metals were detected in at least one method blank sample, including aluminum, antimony, arsenic, calcium, chromium, copper, magnesium, potassium, selenium and sodium. All of the metals were detected below their respective NJDEP criteria. Any subsequent evaluation of the metals analytical results must account for the possibility of laboratory contamination resulting in false positives for the environmental samples; however, metals are not the primary COCs for the M-5 Landfill site, so the impact to the project results is minimal.

Trip Blanks

Four trip blanks were included as part of the M-5 Landfill site sampling programs to document that volatile organics were not introduced into the samples during the handling process. The trip blanks were prepared by FMETL and consisted of sample bottles filled with laboratory deionized water. The trip blanks remained with the sample bottles in coolers and were returned to the laboratory for analysis with the groundwater samples.

One VOC, chloroform, was detected in each of the four trip blanks at concentrations below its NJDEP criteria. The detections of chloroform indicate that the sample handling procedures, including the sample glassware, may have introduced contamination into the sampling and analysis process. However, the primary contaminant of concern, PCE, was not detected in any of the trip blanks.

Field Blanks

One field blank sample was obtained during each day's sampling activities to document the equipment decontamination procedures. A total of four field samples (e.g., field blanks) were collected during the M-5 Landfill site sampling events. The field blanks were collected by rinsing deionized water, supplied by the laboratory, over the sampling equipment used for each day's activities. The water was collected in clean laboratory-supplied sample jars and submitted for analysis along with the M-5 Landfill site groundwater samples.

The results of the field blank analyses showed that one VOC, chloroform, was detected in each of the four field blanks. As noted for the trip blanks, the detections of chloroform indicate that the sample handling procedures, including the sample glassware, may have introduced contamination into the sampling and analysis process. In addition, the same VOC found in the field blanks were also found in the trip blanks, suggesting that the sampling and decontamination procedures did not introduce additional contamination. The primary contaminant of concern, PCE, was not detected in any of the field blanks.

As noted for the method blanks, several metals were detected in at least one field blank sample, including aluminum, barium, beryllium, calcium, copper, iron, lead, magnesium, manganese, potassium, selenium, sodium and zinc. Most of the metals were detected in only a few samples at very low concentrations. However, aluminum was detected in one field blank at a concentration greater than its NJDEP criteria. Because some of these metals were also detected in the method blank samples, the sampling and decontamination procedures do not appear to have been the source of sample contamination. However, any subsequent evaluation of the metals analytical results must account for the possibility of laboratory contamination resulting in false positives for the environmental samples.

Duplicate Samples

Four field duplicate samples were also collected during the M-5 Landfill site sampling events to verify the consistency of the entire sampling and analytical procedure. The results for all of the duplicate samples were close to those obtained for the original samples. The relative percent differences (RPDs) for the duplicate samples VOCs ranged

from 3.3% to 29.6%, and the RPDs for PCE ranged from 4.2% to 14.2%. These RPDs are well below the established limit of 30% for laboratory duplicate samples and indicate that a high level of precision was maintained throughout the sampling and analytical procedures.

The RPDs for the duplicate samples metals analyses ranged from 0.0% to 87.8%, however, the average RPD for all of the metals results is 15.3%. This indicates that, overall, good precision was maintained, but that the metals results were much more varied than those for the VOCs. The apparent metals contamination noted in the method and field blanks may have impacted the precision of the metals analysis.

The QC sample results indicate good precision for all of the analyses. However, the presence of metals in the method blanks and field blanks indicate that contamination may have been introduced by the sampling and analysis procedures. Therefore, any subsequent evaluation of the metals analytical results must account for the possibility of laboratory contamination resulting in false positives for the environmental samples.

6.0 REMEDIAL ACTION PROGRESS

The data support the effectiveness of HRC® treatment program. A general decreasing trend of PCE concentrations (**Figure 5-2** through **Figure 5-7**) was observed in groundwater monitoring wells M5-MW11, M5-MW18, M5-MW19, M5-MW20 and M5-MW23 during this period of groundwater sampling (4th Quarter 2002 through 3rd Quarter 2003).

6.1 Progress

As PCE continued to decrease over time, there was a significant increase in the daughter products - TCE and cis-1,2-DCE over time. The groundwater analytical results presented in **Table 5-1** through **5-12** indicate that concentrations of TCE and cis-1,2-DCE were detected in groundwater during several sampling rounds at more than one monitoring well location. **Figure 5-2** through **Figure 5-7** illustrated the decreasing trend of PCE concentrations as well as the increase of daughter product concentrations observed in groundwater monitoring wells M5-MW11, M5-MW18, M5-MW19, M5-MW20 and M5-MW23 during 4th Quarter 2002 through 3rd Quarter 2003 of groundwater sampling. Overall, the evidence of an increase in daughter products supports the contention that PCE degradation is occurring at the M-5 Landfill site.

Based on the general decreasing trend of PCE concentrations and the increasing indication of degradation products detected in the groundwater, as well as surface water sampling results for the M-5 Landfill site, the HRC® subsurface injection program appears to continue to be effective in remediating PCE contamination at this site.

6.2 Costs

The estimated costs for implementation of the remedial actions performed at the M-5 Landfill site per injection event are provided below:

Estimated Costs of Remedial Actions Performed at the M-5 Landfill Per Injection Event

TASK	ESTIMATED COSTS
1. Third HRC® Injection (8,480 lbs)	$ 51,900
2. Total Labor Cost	$ 38,000
3. Laboratory Cost (one quarter)	$ 10,300
TOTAL ESTIMATED COSTS	$ 100,000

6.3 Discharge to Groundwater Permit

A NJPDES DGW permit application was submitted in November 2001 to obtain approval for continuation of the HRC® injection program at the M-5 Landfill site. The third round of HRC® injections commenced as of June 2003 as an extension of the NJDEP Permit by Rule approval. Subsequent injections will be performed under NJDEP regulatory requirements.

6.4 Recommendations

The HRC treatment program for the remediation of the PCE at the M-5 Landfill site will continue using the same methodology as during the first and second treatments, described in the RAWP prepared by ATC (**Appendix A**). A maximum of two treatments per year will follow. There are no recommendations for changes to the M-5 Landfill site remediation program at this time. The effectiveness of the HRC® treatment, methodologies, field activities and analytical data will continue to be reported to the NJDEP in progress reports. Groundwater and surface water monitoring and sampling will continue as part of the LTM Program at the installation. The final injection of HRC is expected to be performed in the fall of 2005.

The table below provides a summary of the proposed changes to the current quarterly groundwater and surface water sampling program at the M-5 Landfill site. Alterations involving laboratory analyses and the elimination of certain wells from the program are based on the distribution of PCE over time. Proposed changes will be implemented unless otherwise directed by the NJDEP.

Monitoring Well	Analyzed for	Future Sampling Status	Reason
M5-MW10	VOCs, SVOCs, pesticides, PCBs, Metals	Continue VOCs Quarterly	No COC exceedences for four rounds, but is downgradient of exceeding wells
M5-MW11	VOCs, SVOCs, pesticides, PCBs, Metals	Continue VOCs Quarterly	COC exceedences
M5-MW12	VOCs, SVOCs, pesticides, PCBs, Metals	Continue VOCs Quarterly	No COC exceedences for four rounds, but is downgradient of exceeding wells
M5-MW13	VOCs, SVOCs, pesticides, PCBs, Metals	Continue VOCs Quarterly	No COC exceedences for four rounds, but is downgradient of exceeding wells

Monitoring Well	Analyzed for	Future Sampling Status	Reason
M5-MW14	VOCs, SVOCs, pesticides, PCBs, Metals	Continue VOCs Quarterly	No COC exceedences for four rounds, but is downgradient of exceeding wells
M5-MW15	VOCs, SVOCs, pesticides, PCBs, Metals	Eliminate	No COC exceedences for four rounds, upgradient
M5-MW16	VOCs, SVOCs, pesticides, PCBs, Metals	Continue VOCs Quarterly	COC exceedences
M5-MW18	VOCs, SVOCs, pesticides, PCBs, Metals	Eliminate	No COC exceedences for four rounds, upgradient
M5-MW19	VOCs, SVOCs, pesticides, PCBs, Metals	Continue VOCs Quarterly	COC exceedences
M5-MW20	VOCs, SVOCs, pesticides, PCBs, Metals	Continue VOCs Quarterly	COC exceedences
M5-MW23	VOCs, SVOCs, pesticides, PCBs, Metals	Continue VOCs Quarterly	COC exceedences
M5-MW25	VOCs, SVOCs, pesticides, PCBs, Metals	Eliminate	No COC exceedences for four rounds, upgradient

Stream Site	Analyzed for	Future Sampling Status	Reason
SS-4	VOCs, pesticides, PCBs	Eliminate	COC detections; no exceedences for four rounds, but is downgradient of exceeding wells.
SS-5	VOCs, pesticides, PCBs	Continue VOCs Quarterly	COC detections; no exceedences for four rounds, but is downgradient of exceeding wells.
SS-15	VOCs, pesticides, PCBs	Continue VOCs Quarterly	COC detections; no exceedences for four rounds.
SS-16	VOCs, pesticides, PCBs	Eliminate	COC detections; no exceedences for four rounds.

Notes: VOCs = volatile organic compounds; SVOCs = semi-volatile organic compounds; PCBs = polychlorinated biphenyls; MDL = Method Detection Limit;
ND = Not Detected; ug/L = micrograms per liter, equivalent to parts per billion (ppb); NA = Not Analyzed/Not Applicable;
Criterion = GW Criterion: NJDEP Groundwater Quality Criteria (Higher of GWQC and PQL) per N.J.A.C. 7:9-6
Shaded block identifies sample and associated constituent concentration that exceeds the criterion. * = Interim Criterion.

NOTES

1. ALL MAPPED SAMPLING POINTS WERE SAMPLED; ONLY DATA FROM SAMPLING POINTS WITH EXCEEDENCES OF THE NJDEP GWQC OR SWQS ARE SHOWN.
2. ONLY MONITORING WELLS THAT WERE PART OF THE M5 INVESTIGATION ARE MAPPED.
3. SEVERAL OTHER CONTAMINANTS WERE DETECTED AT THESE SAMPLING POINTS, AND SOME OF THE DETECTED CONTAMINANTS WERE IN EXCEEDANCE OF THE APPLICABLE NJDEP STANDARDS. HOWEVER, THESE OTHER CONTAMINANTS ARE NOT CONSIDERED TO BE OF CONCERN FOR THIS SITE. FOR A DISCUSSION OF THE OTHER CONTAMINANTS DETECTED AT THIS SITE, PLEASE SEE SECTION 1.5 OF THE REMEDIAL ACTION WORK PLAN.

EXECUTIVE SUMMARY

In April 1995 the Fort Monmouth Directorate of Public Works (DPW) began its Remedial Investigation of Landfill M-5 at Fort Monmouth – Main Post. The purpose of this investigation was to collect samples in order to evaluate the soil, groundwater and surface water quality at and in the vicinity of the Landfill M-5, and to prepare a Remedial Action Work Plan (RAWP) to address the need for remediation of these media, if necessary. In general, the Remedial Investigation was conducted by the DPW. ATC Associates, Inc. (ATC) was contracted by the DPW to evaluate the data, and to prepare this RAWP for Landfill M-5.

This Remedial Investigation involved drilling and sampling 261 Geoprobe soil borings for soil and groundwater, installing 12 new shallow groundwater monitoring wells, drilling three deep soil borings, and sampling two groundwater monitoring wells for eleven events, three groundwater monitoring wells for six events, and ten groundwater monitoring wells for three events. The results of this investigation indicate that the shallow groundwater contained volatile organic compounds (VOCs), particularly tetrachloroethene (PCE), in excess of the New Jersey Department of Environmental Protection (NJDEP) Groundwater Quality Criteria (GWQC).

The concentrations and distribution of PCE in the soil and groundwater at Landfill M-5 suggest that this location is suitable for a Natural Remediation program. In general, PCE concentrations are expected to come into compliance with the New Jersey Department of Environmental Protection's (NJDEP) Class II Groundwater Quality Criteria (GWQC) within a five year period, and the PCE contamination is expected to migrate approximately 54 feet during this time frame.

Although PCE concentrations are expected to naturally attenuate to acceptable levels, the DPW wishes to shorten the time required for compliance with the GWQC. Therefore, the DPW proposes to actively remediate existing concentrations of PCE by treating the affected areas with Hydrogen Releasing Compound (HRC). The DPW is proposing a specific application protocol and a groundwater sampling program designed to measure the effectiveness of groundwater remediation.

1.0 REMEDIAL INVESTIGATION REPORT

This document is a Remedial Action Work Plan (RAWP) for the soils and groundwater at Landfill M-5, located on the Main Post of Fort Monmouth, New Jersey (Figures 1 and 2). It has been prepared by ATC Associates, Inc. (ATC), on behalf of the Fort Monmouth Directorate of Public Works (DPW), and is based on the data presented in the December 1995 *Site Investigation Report* (SIR), by Roy F. Weston, Inc. (Weston), as well as groundwater and surface water sampling data collected by the DPW between May 8, 1997 and September 14, 1999 and soil sampling data collected by the DPW between April 8, 1998 and March 30, 1999. This RAWP has been prepared in accordance with the New Jersey Department of Environmental Protection's (NJDEP) July 1993 *Technical Requirements for Site Remediation - NJAC 7:26E* (Technical Requirements).

1.1 Historical Information

According to the Weston SIR, Landfill M-5 was in use as a landfill between 1952 and 1959. Materials generally found in Main Post landfills include unwashed pesticide/herbicide cans, batteries, fluorescent tubes, electronic components, garbage, asbestos wrappings from pipes, soot and boiler scale, sludge from sanitary treatment plants (STPs), small quantities of outdated drugs, outdated photographic chemicals in glass bottles, building rubble including asbestos-containing materials (ACM), incinerator ash, sand from oil spill cleanups, and other debris. Landfill M-5 also was reportedly used for the disposal of automobiles.

1.2 Physical Setting

1.2.1 Site Description

Landfill M-5 is located on the western portion of the Main Post, just west of the Eatontown/Oceanport Borough line. The site is located on the northwest corner of the intersection of North Drive and Wilson Avenue, and is bound by Mill Creek to the west (Figure 2). The approximate area of Landfill M-5 is 138,200 ft^2 (3.2 acres). This landfill was constructed in a former swamp, and is presently flat and grass covered.

1.2.2 Regional Geology

Fort Monmouth is located within the New Jersey Section of the Atlantic Coastal Plain physiographic province. In general, New Jersey Coastal Plain formations consist of northeast striking deposits of unconsolidated clay, silt, and gravel. These sediments, predominantly derived from deltaic, shallow marine, and continental shelf environments, date from Cretaceous through the Quaternary Periods. The mineralogy ranges from quartz to glauconite.

Over 20 regional geologic units are present within the sediments of the New Jersey Coastal Plain. Regressive, upward coarsening deposits are usually aquifers (e.g., Englishtown and Kirkwood Formations, and the Cohansey Sand), while the transgressive deposits act as confining units (e.g., the

Merchantville, Marshalltown, and Navesink Formations). The individual thickness for these units vary greatly (i.e., from several feet to several hundred feet).

1.2.3 Local Geology

Based on the regional geologic map (Jablonski, 1968), the Cretaceous age Red Bank and Tinton Sands outcrop at the Main Post area. The Red Bank sand conformably overlies the Navesink Formation and dips to the southeast at 35 feet per mile. The upper member (Shrewsbury) of the Red Bank sand is a yellowish-gray to reddish brown clayey, medium- to coarse-grained sand that contains abundant rock fragments, minor mica and glauconite (Jablonski). The lower member (Sandy Hook) is a dark gray to black; medium-to-fine grained sand with abundant clay, mica, and glauconite.

The Tinton sand conformably overlies the Red Bank Sand and ranges from a clayey medium to very coarse grained feldspathic quartz and glauconite sand to a glauconitic coarse sand. The color varies from dark yellowish orange or light brown to moderate brown and from light olive to grayish olive. Glauconite may constitute 60 to 80 percent of the sand fraction in the upper part of the unit (Minard, 1969). The upper part of the Tinton is often highly oxidized and iron oxide encrusted (Minard).

The boring logs from the on-site monitoring wells installed between December 1994 and March 1999, indicate that the soils in Landfill M-5 area and in the vicinity of Landfill M-5 consist of a thin soil cover of brown sandy silt (approximately one foot thick) underlain by approximately seven feet of olive/brown poorly graded sand with silt. This is in turn underlain by an 8-foot layer (8- to 16-feet below grade) of green/brown sandy silt. A dark green dense to very dense silty sand/clayey sand, with clay contents increasing with depth, extends from 16- to at least 60-feet below grade or the depth of the borings.

Over the last 80 years, the natural topography of Fort Monmouth has been altered by excavation and filling activities by the military. Topographic elevations for Landfill M-5 range from 10 feet above mean sea level (MSL) to 15 feet above MSL.

1.2.4 Hydrogeology

The water table aquifer in the Main Post area is identified as part of the "composite confining units", or minor aquifers. The minor aquifers include the Navesink formation, Red Bank Sand, Tinton Sand, Hornerstown Sand, Vincentown Formation, Manasquan Formation, Shark River Formation, Piney Point Formation, and the basal clay of the Kirkwood Formation.

Based on records of wells drilled in the Main Post area, groundwater is typically encountered at depths of 2 to 9 feet below ground surface (bgs). According to the boring logs from monitoring wells drilled at Landfill M-5, groundwater was encountered on-site between 4 foot to 8-foot bgs, during drilling activities. According to groundwater monitoring data collected during quarterly monitoring events performed at Landfill M-5 between May 8, 1997 and September 14, 1999, groundwater was encountered on site at depths between 1.40 feet to 11.59 feet. Groundwater monitoring data for the last four monitoring events – February 2, 1999, April 13, 1999, April 27, 1999, and September 13,

1999 – were used to generate groundwater elevation contour maps (Figures 3 through 6). For these groundwater monitoring events, groundwater flow was calculated to be toward the west-northwest, consistent with the Weston SIR, which reported that the site-specific groundwater flow direction was estimated to be west toward Mill Creek. Due to the proximity of the Atlantic Ocean to Fort Monmouth, shallow groundwater may be tidally influenced and may flow toward creeks and brooks as the tide goes out, and away from creeks and brooks as the tide comes in.

According to Jablonski, wells drilled in the Red Bank and Tinton Sands may produce 2 to 25 gallons per minute (gpm). Monitoring well MW-10 reportedly produced 5.0 gpm, MW-11 produced 1.5 gpm, and M5MW-19 produced approximately 3.2 gpm during the pump test. Some well owners have reported acidic water that requires treatment to remove iron.

1.3 Technical Overview

1.3.1 Reliability of Laboratory Data

The soil and groundwater samples collected during Geoprobe drilling activities and the surface water and groundwater samples collected during quarterly sampling events were analyzed within the requisite holding times by Fort Monmouth Environmental Testing Laboratory, Fort Monmouth, New Jersey (NJDEP Certification # 13461).

1.3.2 Summary of Contamination

In five of the 261 soil samples collected from Landfill M-5, tetrachloroethene (PCE) was detected at concentrations exceeding New Jersey Department of Environmental Protection's (NJDEP) Impact to Groundwater Soil Cleanup Criteria (IGWSCC) of 1.0 milligram per kilogram (mg/kg), equivalent to parts per million (ppm).

In five of the monitoring wells in the Landfill M-5 area, PCE was detected at concentrations exceeding the NJDEP Class II Groundwater Quality Criteria (GWQC) of 1.0 microgram per liter (µg/L), equivalent to parts per billion (ppb).

Detailed descriptions of the soil, groundwater, and surface water impacts in the Landfill M-5 area are presented in Section 1.5 of this document.

1.4 Remedial Investigation Methodology

1.4.1 Geoprobe Borings/ Soil and Groundwater Sampling

Between April 8, 1998 and December 17, 1998, a total of 261 Geoprobe points were drilled (B1 through B197 and B254 through B318). One soil and groundwater samples were collected from each Geoprobe location. The purpose of collecting groundwater samples using the Geoprobe was to provide a screening tool for determining the gross distribution of groundwater impacts. This data was confirmed through the installation of permanent monitoring wells, as described in Sections 1.4.3 and

1.4.4. The methodologies for collecting these soil and groundwater samples are presented as Appendix A.

1.4.2 Soil Borings

In order to determine the vertical extent of soil contamination, and in an attempt to determine the source of soil and groundwater impacts encountered during Geoprobe sampling, on March 25, 1999, March 30, 1999, and March 31, 1999, three 2-inch soil borings were drilled at M5 area. Soil borings M5SB17 and M5SB20 were advanced to a depth of approximately 60 feet and soil boring M5SB23 was advanced to a depth of approximately 42 feet. A hollow stem auger drill rig was used to advance the boring at each location. Continuous split-spoon samplers were advanced in each boring. Soil samples were collected continuously in each boring using a two-foot long, two-inch diameter split-spoon sampler that was advanced under the weight of a 140-pound hammer. Each split-spoon was visually inspected, field screened using a photoionization detector (PID) or a flame ionization detector (FID), and logged for lithology in the field. Soil boring locations are shown on Figure 7, and boring logs are included in Appendix B.

Fourteen soil samples were collected and analyzed for total organic carbon concentrations, eight soil samples were collected and analyzed for grain size analysis, and five soil samples were analyzed for volatile organic compounds, including xylenes and 15 tentatively identified compounds (VOC+15). Analytical data reports are included as Appendix C.

After completion, each boring was abandoned by tremie-grouting the boring from the bottom to the ground surface with a cement/bentonite mixture, per NJDEP requirements.

1.4.3 Monitoring Well Installation

Three monitoring wells – MW-10, MW-11, and M8MW-12 – were installed in 1995 by Weston during site investigation field activities. Well logs and well construction were included in Weston's SIR. In an attempt to delineate the groundwater contamination in the direction of Mill Creek, the potential receptor, three groundwater monitoring wells – MW-12, MW-13, and MW-14 – were drilled and installed between August 27, 1998 and August 31, 1998. A hollow stem auger drill rig was used to advance the boring at each well location. The wells were constructed of 2-inch diameter schedule 40 PVC screen and casing, and were installed at depths between approximately 15 feet to approximately 20 feet below surface grade. The screen interval in each well extends from approximately 5 feet to the bottom of the well. The annular space surrounding the screen was filled with #2 grade sand to a level at least one foot above the top of the screen in each well. The remainder of the annular space surrounding each well was filled with cement/bentonite grout to surface. Each monitoring well was finished with approximately 2.5 feet PVC casing above land surface protected by a 6-inch steel protective casing. Upon completion, the monitoring wells were developed, using a submersible pump, until the ground water was visibly free of sediments. The wells were installed and developed by Groundwater and Environmental Services, Inc., a licensed New Jersey drilling company. The monitoring wells were

installed in accordance with standard NJDEP procedures for the installation of wells in unconsolidated materials. Monitoring well locations are shown on Figure 2.

In order to confirm the results of the Geoprobe soil and groundwater investigation, between March 24, 1999 and March 30, 1999, nine additional monitoring wells (M5MW-15, M5MW-16, M5MW-18, M5MW-19, M5MW-20, M5MW-23, M5MW-25, M8MW-23, and M8MW-24) were installed at Landfill M-5 and immediately adjacent to Landfill M-5. Locations of these monitoring wells are shown on Figure 2. A hollow stem auger drill rig was used to advance the boring at each well location. Soil samples were collected using a two-foot long, two-inch diameter split-spoon sampler that was advanced under the weight of a 140-pound hammer. Each split-spoon was visually inspected, field screened using a photoionization detector (PID) or a flame ionization detector (FID), and logged for lithology in the field.

The wells were constructed of 4-inch diameter schedule 40 PVC screen and casing, and were installed at depths between approximately 14 feet to approximately 18 feet below surface grade. The screen interval in each well extends from approximately 3 to 5 feet to the bottom of the well. The annular space surrounding the screen was filled with #2 grade sand to a level at least one foot above the top of the screen in each well. The remainder of the annular space surrounding each well was filled with cement/bentonite grout to surface. Each monitoring well was finished with approximately 3.0 feet PVC casing above land surface protected by a 6-inch steel protective casing. Upon completion, the monitoring wells were developed, using a submersible pump, until the ground water was visibly free of sediments. The wells were installed and developed by Lutz Environmental Inc., a licensed New Jersey drilling company, under the direct supervision of the ATC professional geologist. The monitoring wells were installed in accordance with standard NJDEP procedures for the installation of wells in unconsolidated materials. Monitoring well logs and construction details are included as Appendix B and monitoring well records are attached in Appendix D.

1.4.4 Groundwater Monitoring and Sampling

Between May 8, 1997 and September 14, 1999, during ten consecutive quarters, 11 rounds of groundwater sampling events were performed at monitoring wells MW-10 and MW-11, six rounds of sampling events were performed at MW-12, MW-13, and MW-14 during four consecutive quarters, and three rounds of sampling events were performed at M5MW-15, M5MW-16, M5MW18, M5MW19, M5MW20, M5MW23, M5MW25, M8MW12, during two consecutive quarters. Also, between May 8, 1997 and September 14, 1999, 12 rounds of sampling events were performed at M8MW12 during ten consecutive quarters, and three rounds of sampling events were performed at M8MW23, M8MW24 during two consecutive quarters. Sampling events were performed in accordance with the NJDEP's *Field Sampling Procedures Manual* (May 1992), and the DPW - Standard Operation Procedure (SOP). For groundwater sampling procedures and methodology please refer to Appendix A. Groundwater monitoring and sampling field notes for May 8, 1997 are included in Appendix F, for August 8, 1997 in Appendix G, for October 29, 1997 in Appendix H, for February 18, 1998 in Appendix I, for May 6, 1998 in Appendix J, for August 4, 1998 in Appendix K, for October 7, 1998 in Appendix L, for October 21, 1998 in Appendix M, for October 27, 1998 in

Appendix N, for February 2, 1999 in Appendix O, for April 13, 1999 in Appendix P, for April 27, 1999 in Appendix Q, and for September 13-14, 1999 in Appendix R.

Groundwater samples were preserved, chilled to 4°C, and delivered to Fort Monmouth Environmental Testing Laboratory, Fort Monmouth, New Jersey, where they were analyzed for volatile organic compounds (VOC+15), semivolatile organic compounds (SVOC+15), priority pollutant metals, pesticides, and polychlorinated biphenyls (PCBs).

1.4.5 Survey of the Monitoring Wells

The newly installed monitoring wells MW-12, MW-13, MW-14, M5MW-15, M5MW-16, M5MW-18, M5MW-19, M5MW-20, M5MW-23, M5MW-25, M8MW-23, and M8MW-24, were surveyed relative to NJGCS Monument Number 9235, with an elevation of 56.69 feet, by Frederick W. Kocen Jr., Professional Land Surveyor (License # 34008). Copies of the Ground Water Monitoring Well Certification - Form B - Location Certifications are attached in Appendix S.

1.4.6 Surface Water Sampling

Three surface water bodies – Parkers Creek, Lafetra Creek, and Mill Creek – flow near or adjacent to the Landfill M-5 site. Due to salinity concentrations greater than 3.5 parts per thousand at mean high tide, the surface water of these creeks are classified as SC - coastal saline waters and SE - saline waters of estuaries. Surface water sample SS-5 is located to the west of Landfill M-5, near the confluence of Mill Creek and Lafetra Creek. Surface water sample SS-4 is located to the northeast and downstream of Landfill M-5, along Parkers Creek. Sampling points SS-15 and SS-16 are located upstream from Landfill M-5, along Mill Creek. Between October 1996 and June 1999, periodic rounds of samples were collected from several surface water sampling points along these water bodies.

1.4.7 Aquifer Pump Testing

An aquifer testing program was conducted on June 14, 1999 to evaluate the hydraulic conductivity of the shallow aquifer. In-situ hydraulic conductivity of the shallow, saturated, unconsolidated materials underlying the site was determined by means of a constant discharge aquifer test.

Groundwater level data was collected from five groundwater monitoring wells (M5MW-16, M5MW-18, M5MW-20, M5MW-11, and M5MW-23 prior to the pumping test. Groundwater monitoring well M5MW-19 was chosen as the pumping well, and a submersible pump was suspended approximately 2 feet from the bottom of the well. Water level in the five monitoring wells were monitored during the test, the groundwater being measured manually using an electronic water level indicator. The pumping well was monitored using a pressure transducer and an electronic datalogger. Wells measured manually were checked every 15 minutes for the first hour and every 30 minutes until the end of the test. Immediately upon pump shutdown, recovery was measured with a data logger in the pumping well for approximately 35 minutes.

1.5 Remedial Investigation Results

1.5.1 Soil Quality

Between April 1998 and December 1998, a total of 261 soil samples were collected using a Geoprobe rig. The samples were collected from six inch interval above the water table interface, at depths ranging from 17 to 142 inches below ground surface (bgs). Laboratory analysis results are summarized on Table 1. Volatile organic compound (VOC) analysis revealed that only tetrachloroethene (PCE) was present in concentrations exceeding the NJDEP Impact to Groundwater Soil Cleanup Criteria (IGWSCC). PCE concentrations ranging from 0.320 to 3.300 milligrams per kilogram (mg/kg) were detected. Five soil samples were found to contain levels of PCE greater than 1 mg/kg (the IGWSCC for PCE). Concentrations of PCE in these five soil samples ranged from 1.1 mg/kg to 3.3 mg/kg, and are mapped on Figure 7. The analytical results are presented as Table 1, and the analytical data is included in Appendix C.

As per N.J.A.C. 7:26E-4.8, the average concentration for PCE was calculated to be 1.15 mg/kg, for the contaminated area (soil borings numbers 39, 40, 41, 68, 69, 70, 71, and 72). It is important to note that these exceedances are very minor relative to NJDEP-IGWSCC, and their detection immediately above the water table is likely indicative of impacted groundwater during the seasonal water table fluctuation rather than a soil source.

In addition to the soil samples discussed above, in a attempt to vertically delineate PCE concentrations in soil, three deep soil borings were advanced in March 1999 using a hollow stem auger drill rig. Soil samples were taken from various depths between 9 and 42 feet bgs at two of these borings, M5SB17 and M5SB23. At several depths, acetone and methylene chloride were detected in the soil at concentrations above their respective NJDEP IGWSCC; however, these analytes were also detected at elevated levels in associated method blanks and trip blanks. No other analytes were detected at levels exceeding their respective NJDEP IGWSCC. A summary of soil sampling analytical results is included in Table 1, and analytical data reports are included as Appendix C.

1.5.2 Groundwater Quality

Between April and December 1998, a total of 261 groundwater samples were collected using a Geoprobe technique (hydropunch). Laboratory analysis results are summarized on Table 2. VOC analysis revealed that trichlorothene (TCE), PCE, cis-1,2-dichloroethene, chlorobenzene, benzene, toluene, ethylbenzene, and total xylenes were present in concentrations above their respective method detection limits. Of these, TCE, PCE, cis-1,2-dichloroethene, chlorobenzene, and benzene were detected at concentrations exceeding their respective NJDEP GWQCs. TCE concentrations between 1.54 µg/L and 4.40 µg/L were detected in six Geoprobe locations. PCE concentrations between 1.00 µg/L and 1459.64 µg/L were detected at 105 Geoprobe locations across the site. Cis-1,2-dichloroethene concentrations between 0.48 µg/L and 16.47 µg/L were detected at 10 Geoprobe locations. Chlorobenzene concentrations between 2.01 µg/L and 73.23 µg/L were detected at five Geoprobe locations. Benzene concentrations were reported at concentrations between 1.13 µg/L and

15.89 µg/L in nine Geoprobe locations located north of Landfill M-5, at Landfill M-8. Toluene concentrations between 1.26 µg/L and 18.11 µg/L were reported at nine Geoprobe locations. Ethylbenzene concentrations between 1.13 µg/L and 5.70 µg/L were reported at seven Geoprobe locations. Total xylene concentrations between 1.52 µg/L and 16.82 µg/L were reported at 10 locations. These exceedances are mapped on Figure 8. Analytical data is presented as Appendix E.

Eleven rounds of groundwater monitoring well sampling events were conducted between May 1997 and September 1999. A total of fifteen monitoring wells located on and around Landfill M-5, were sampled. With the exception of groundwater monitoring wells MW-10, MW-11, and M8MW12 not every well was sampled for each round of sampling. Historically, separate phase hydrocarbons were not reported in any of the monitoring wells. The historical analytical results for each well are presented in Tables 3 through 17. Eight VOCs, four semivolatile organic compounds (SVOCs), and 23 metals were detected above their respective method detection limits in at least one sampling round apiece. Of these, tetrachloroethene (PCE) and ten metals (aluminum, arsenic, cadmium, iron, lead, manganese, sodium, mercury, silver, and zinc) were detected at concentrations exceeding their respective GWQCs. The PCE exceedances, ranging from 2.15 µg/L to 639.74 µg/L, are mapped on Figure 9. Five of the metals detected (aluminum, manganese, sodium, iron, and zinc) were found in concentrations below those determined for site-specific and Monmouth County maximum background levels. As mentioned in Weston's SIR, several natural and anthropogenic factors contribute to the wide range in concentrations of metals in soils. Soils derived from the glauconitic sands contain abundant iron, aluminum, calcium, magnesium, manganese, and potassium. Anthropogenic influences on the background metal concentrations include deposition of airborne dust, and historical applications of fertilizers, pesticides, and herbicides can account for the elevated levels of lead, cadmium, and arsenic. Silver was noted in several testing rounds at elevated levels; however, this analyte was also detected at elevated levels in associated method blanks. The last metal with a noted exceedance, mercury, was detected in one monitoring well located at Landfill M-8. This contaminant will be discussed in the Remedial Action Work Plan for Landfill M-8.

Historically, a decrease in PCE concentrations has been noted in all monitoring wells, except M5MW-15 and M5MW-16. In M5MW-15, PCE concentrations slightly increased from non-detect (ND) on April 14, 1999 and April 28, 1999 to 2.15 µg/L on September 13, 1999. In M5MW-16, PCE concentrations decreased from 96.57 µg/L on April 14, 1999 to 8.65 µg/L on April 28, 1999, then increased to 639.74 µg/L on September 14, 1999. In M8MW-12, PCE concentrations decreased from 4.27 µg/L on January 27, 1999 to ND on April 14, 1999 and April 28, 1999, then increased to 46.06 µg/L on June 22, 1999. Two other monitoring wells – MW-19 and MW-20 – have shown periodic increases in measured PCE concentrations, but the overall trend of these fluctuations is downward. Three PCE isopleth maps, from April 13 and 14, 1999, April 27 and 28, 1999, and September 13 and 14, 1999, sampling events are included as Figures 11, 12, and 13, respectively. The laboratory reports are included in Appendices F through R.

1.5.3 Surface Water Quality

Laboratory analysis results from the 14 rounds of surface water sampling are summarized on Table 18. VOC analysis revealed that acetone, cis-1,2-dichloroethene, methylene chloride, TCE, and PCE were present in concentrations above their respective method detection limits. Of these, only PCE was detected at concentrations exceeding its NJDEP Surface Water Quality Standard (SWQS) of 4.29 µg/L (as per N.J.A.C. 7:9-6 2 - September 1997). PCE concentrations ranging from 1.24 µg/L to 10.38 µg/L were detected. The exceedances are mapped on Figure 9. Analytical data is presented in Appendix T.

Referring to Figure 9, the latest stream sampling data (from June 29, 1999) shows that PCE concentrations at SS-15 (7.86 µg/L) and SS-16 (7.70 µg/L) were reported at higher concentrations than surface water collected from SS-4 (5.27 µg/L) and SS-5 (6.04 µg/L). Since SS-15 is located close to where the stream enters Fort Monmouth, and since SS-15 and SS-16 are located upstream of Landfill M-5, it suggests that surface water is impacted prior to flowing into Fort Monmouth property and that Landfill M-5 is not contributing to the PCE contamination of Mill Creek. This conclusion is further supported by the fact that sentinel wells MW-12, MW-13, and MW-14, which are located along the edge of Mill Creek, historically have never shown any PCE contamination, indicating that the PCE plume has not extended to the creek.

1.5.4 Aquifer Pump Test Results

The objective of this test was to determine aquifer parameters (transmissivity and storativity) by pumping MW-19 and measuring water level drawdown in observation wells MW-11, MW-16, MW-18, MW-20, and MW-23. Monitoring well MW-19 was pumped continuously at an average rate of approximately 2.5 gallons per minute for a period of 150 minutes. The recovery of the water level in the pumping well was measured for 33 minutes. Water level response in the wells were measured and recorded using an In-Situ Inc. Model SE 1000B data logger equipped with a 10-psi pressure transducer.

During the test, drawdown recorded in the observation wells did not exceed 0.01 feet. Because sufficient drawdown was not noted in the recovery wells, a single well aquifer test method was selected to interpret the pumping well drawdown and recovery data. This methodology does not allow for the determination of aquifer storativity.

Data from the tests were downloaded to a personal computer by use of proprietary software supplied by In-Situ Inc., and were analyzed by use of Aquifer^{win32} (version 1.25, Environmental Simulations, Inc.). The Jacob (Cooper and Jacob, 1946) straight line approximation of the Theis equation was applied to the time-drawdown data for well MW-19 to determine aquifer transmissivity. The results of the constant rate aquifer tests are summarized on the following table:

Location	**Description of Test**	**Transmissivity (ft^2/day)**
MW-19	Single Well Drawdown	16.8

	Single Well Recovery	23.1

Water level responses and data interpretation are presented in Appendix U.

Because the recovery data is not influenced by perturbations in the pumping rate, it is assumed that a transmissivity of 23.1 ft^2/day is representative of the shallow unconfined aquifer.

1.6 Sensitive Receptor Survey

1.6.1 Well Search Data

All available DPW records and files were reviewed for information concerning wells within Fort Monmouth. Also, two Well Search reports prepared by Roy F. Weston, dated November 1993 and February 1994, were reviewed for information concerning wells within a one mile radius surrounding the center point of Landfill M-5. The well locations were plotted on a scaled map, included as Figure 14 and a well search summary is presented as Table 19.

The results of the well search indicate the following:

Monitoring Wells: 119 monitoring wells were identified within one mile of the site. These wells were completed at depths between ten and 28 feet, with open or screened intervals ranging between one and 28 feet.

Domestic Wells: Five domestic wells identified within one mile of the site. The depths of these wells ranged between 15 and 323 feet, with open or screened intervals ranging between 40 and 323 feet.

Irrigation Wells: Eight lawn irrigation wells were identified within one mile of the site. The depths of these wells ranged between 45 and 250 feet, with open or screened intervals ranging between 35 and 250 feet.

Public Supply Wells: No public supply wells were identified within one mile of the site.

1.6.2 Receptor Evaluation

Typically, soil, groundwater, and surface water impacts may give rise to concern about human and ecological receptors. However, in the case of Landfill M-5, based on the following, no receptors are expected to be impacted:

1. There are no concerns with respect to direct exposure by humans to impacted soil, because soil impacts were very minor and they exist at depth.
2. Since there are no domestic, irrigation or public supply wells immediately downgradient of Landfill M-5, and since impacted groundwater is expected to naturally attenuate in a very short distance (see Section 1.7), no concerns exist with respect to human exposure to impacted groundwater.

3. Although Mill Creek represents a potential ecological receptor, as discussed previously, Mill Creek is impacted by sources upgradient of Landfill M-5. Based on the discussion in Section 1.5.3 and the discussion in Section 1.7, the impacted groundwater in Landfill M-5 does not appear to have, and is not expected to adversely affect Mill Creek. This conclusion is further supported by the fact that sentinel wells MW-12, MW-13, and MW-14, which are located along the edge of Mill Creek, historically have never shown any PCE contamination, indicating that the PCE plume has not extended to the creek.

1.7 Classification Exception Area

A classification exception area (CEA) is a mechanism that has been established by the NJDEP to temporarily except a defined area where groundwater does not meet the GWQC. As required by the *Groundwater Quality Standards* (N.J.A.C 7:9-6 et seq.), a CEA must be established whenever constituent standards applicable to a groundwater classification area are not, or will not be met for the term of the remediation program. According to the NJDEP's *Final Guidance on Designation of Classification Exception Areas* (April 17, 1995), a CEA is defined by both physical boundaries, and the amount of time that will be required for the groundwater contaminant(s) to achieve compliance with the GWQC.

The Fort Monmouth DPW proposes that the CEA apply to tetrachloroethene (PCE), which is the only contaminant of concern at Landfill M-5. A CEA is appropriate for this site since all sources of contamination have been addressed, no receptors are at risk, and groundwater contamination remains above standards at a level where the residual contaminant plume will not migrate beyond the designated boundary set forth below.

The classification exception area was determined using the analytical solution model option. Darcy's law was used as the model and was used to predict the duration of the CEA and the distance the contaminant will migrate before groundwater quality standards are achieved.

Determination of the Duration of the CEA

A first order decay equation shown below, was used to calculate the duration of the CEA, since the degradation of the petroleum-based compounds has been shown to be logarithmic.

$$C = C_o * e^{-kt} \qquad \textbf{--Eq. 1}$$

where,

C = Final concentration of the contaminant
C_o = Initial concentration of the contaminant
k = Reaction rate constant
t = Time in days

The reaction rate constant k can be determined by the following equation:

$$k = \frac{0.693}{t^{1/2}} \qquad \textbf{--Eq. 2}$$

where,

$t^{1/2}$ = the half life of the corresponding contaminant in days

Data from monitoring well M5MW-20 was used to define the CEA due to its proximity to the source area, and since the consistently amount of the contaminant is detected in M5MW-20. The latest analytical data from monitoring well M5MW-20 (from the September 13, 1999 sampling event) indicated the presence of PCE at a concentration of 156.58 µg/L ($C_\circ$). The final concentration of the contaminant will be 1 µg/L (C) as per the NJDEP's Class II GWQC. As reported by John H. Montgomery in *Groundwater Chemicals Desk Reference, Second Edition* (Montgomery, 1996), significant degradation of PCE was observed after 28 days, and the amount lost due to volatilization after 10 days was 16-23%. As reported in *The Handbook of Environmental Degradation Rates* (Howard, et al., 1991) the low and high half life of PCE in ground water are estimated at 12 months and two years respectively. Based on these facts, an average value of 250 days was used for the half life ($t^{1/2}$) of PCE. Substituting the above values, the reaction rate constant, k is calculated as 0.00272 days $^{-1}$.

Rearranging **Equation 1**, the time duration of the CEA can be determined as follows:

$$t = \frac{\ln\left(\frac{C}{C_o}\right)}{-k} \qquad \textbf{-- Eq. 3}$$

Substituting the values of C, $C_\circ$ and k in **Equation 3**, the duration of the CEA is calculated as follows:

$$t = \frac{\ln\left(\frac{1}{156.58}\right)}{-0.00272}$$

t = 1,858 days (approximately 5 years)

Calculation of the CEA Boundary

The boundary of the CEA is determined by calculating the distance of travel of the contaminant. Distance of travel is calculated from the pollutant transport rate. Seepage velocity (V_s) and Retardation factor (R_d) must be calculated for this purpose. The seepage velocity was calculated using the following equation:

$$V_s = \frac{(K * i)}{n_o} \qquad \textbf{--Eq. 4}$$

where,

K= Hydraulic conductivity of the affected aquifer, (ft/day)
i = Hydraulic gradient (ft/ft)
n_o= Effective porosity

The average hydraulic conductivity from the pumping tests was determined to be 0.996 ft/day. The effective porosity of the formation (dense mixed grained sand) is taken as 30%. The hydraulic gradient at the site is calculated as 0.009 ft/ft. Substituting these values in **Equation 4**:

$$V_s = \frac{(0.996 * 0.009)}{0.3}$$

V_s = 0.029 ft/day

The retardation factor was calculated using the equation:

$$R_d = 1 + \frac{(K_d * s_b)}{n_o} \qquad \textbf{-- Eq. 5}$$

where,

ρ_b = bulk density of the formation
K_d = Distribution co-efficient
n_e = Effective porosity

The distribution co-efficient is calculated from the relation:

$$K_d = 0.63 * K_{ow} * f_{oc} \qquad \textbf{-- Eq. 6}$$

where,

K_{ow} = n-octonol/water partition coefficient
f_{oc} = fraction of the organic carbon in the matrix

The results of the Total Organic Carbon (TOC) content in soil samples collected from the groundwater/soil interface indicated that TOC at the site is present at an average level of 5 mg/kg (See Technion, Inc. Testing & Research Laboratories test results for TOC included as Appendix C). From this the fraction of TOC in the soil matrix, f_{oc} was determined to be 0.000005. According to the *Superfund Public Health Evaluation Manual* (United States Environmental Protection Agency, Office of Emergency and Remedial Response, 1986), the value of K_{ow} is 130. Substituting these values,

$$K_d = 0.63 * 130 * 0.000005$$

$K_d = 0.00041$

The bulk density of the formation was estimated as 1.5 g/cm^3. Substituting the value of K_d, ρ_b and n_e into **Equation 5**, the retardation factor R_d is calculated as follows:

$$R_d = 1 + \frac{(0.00041 * 1.5)}{0.3}$$

$R_d = 1.002$

From the above parameters, the pollutant transport rate (V_{pt}) is determined by dividing the seepage velocity (V_s) by the retardation factor (R_d)

$$V_{pt} = \frac{V_s}{R_d} \qquad \textbf{-- Eq. 7}$$

$$V_{pt} = \frac{0.029}{1.002}$$

V_{pt} = 0.0289 ft/day

The distance traveled by the contaminant is calculated by the relationship, Distance = Transport Rate * Time

$d = V_{pt} * t$ **-- Eq. 8**

$d = 0.0289$ ft/day * 1,858 days

$d = 53.70$ ft

From the calculations, it appears that the migration of contaminants from monitoring well M5MW-20 is very minimal (approximately 54 feet), and PCE concentrations can be expected to naturally attenuate within the property boundaries of the site. Monitoring wells MW-12, MW-13, and MW-14 were proposed as sentinel wells. The latitude and longitude (taken from the NJDEP Well Location Certification forms) of the monitoring wells that mark the area of the CEA are as follows:

Well No.	Latitude	Longitude
MW-12	40°18'48.9"	74°03'04.1"
MW-13	40°18'47.6"	74°03'03.7"
MW-14	40°18'45.7"	74°03'03.2"
M5MW-15	40°18'49.6"	74°02'54.9"
M5MW-18	40°18'48.2"	74°02'59.6"
M5MW-25	40°18'53.27	74°02'56.4"

Geographic Information System (GIS) format is required in cases of active or potential groundwater use within the boundaries of the CEA. Since no groundwater use within CEA boundaries is occurring or is anticipated to occur, the GIS format is not required for the Landfill M-5 site.

The DPW proposes a maximum CEA duration of five years, based on the estimated time for PCE to degrade to its GWQC of 1 µg/L, assuming natural degradation rates. The DPW anticipates that these degradation rates will be significantly increased as a result of implementation of proposed anaerobic bioremediation treatment (See Section 4.1).

1.8 Conclusions and Recommendations

Based on the investigation conducted to date the DPW concludes the following:

- A review of analytical results from Geoprobe soil samples revealed that only tetrachloroethene (PCE) concentrations exceeded the NJDEP IGWSCC, and that exceedances were discovered at five of 261 soil sample locations. It is important to note that these exceedances are very minor relative to NJDEP IGWSCC, and their detection immediately above the water table is likely indicative of impacted groundwater during the seasonal water table fluctuations rather than a soil source.
- In the Main Post area, groundwater is typically encountered at depths of 1.40 to 11.59 feet below ground surface. Ground water flow was calculated to be toward the west-northwest, toward Mill Creek, consistent with previous data.
- Historically, separate phase hydrocarbons were not reported in any of the monitoring wells.
- Groundwater analytical results from the permanent monitoring wells identified PCE as the only contaminant of concern across Landfill M-5, with exceedances of the NJDEP GWQC noted in eight monitoring wells. While several other analytes were detected at concentrations above their respective GWQC, these contaminants are not considered a concern for reasons discussed in Section 1.5 of this report.
- Historically, a decrease in PCE concentrations was noted in all monitoring wells, except M5MW-15, M5MW-16, and M8MW-12, as discussed in Section 1.5.2.
- The duration of the CEA for PCE was calculated to be 1,858 days (approximately five years).
- Groundwater PCE contamination is localized in seven areas of concern, limited in extent, and can be expected to naturally degrade overtime without significant migration.
- The surface water samples collected from four locations along Mill Creek, as well as groundwater analytical results from the sentinel wells MW-12, MW-13, and MW-14, show that the Landfill M-5 site is not a contributor of PCE contamination of Mill Creek.

Based on the above conclusions, the DPW proposes to implement a natural remediation program. Simultaneously, an aerobic and anaerobic bioremediation treatment program will be implemented to increase the degradation rate of the contaminant of concern (PCE) in groundwater at the Landfill M-5 and adjacent to Landfill M-5, below the NJDEP criteria.

2.0 STATEMENT OF INTENT TO COMPLETE N.J.A.C. 7:26E

It is the DPW's intention that adherence to the remediation program outlined in this RAWP will result in compliance with the criteria set forth in N.J.A.C. 7-26E (7/93).

3.0 APPLICABLE REMEDIATION STANDARDS

The remediation standards for the groundwater at Landfill M-5 its vicinity will be the NJDEP Ground Water Quality Criteria (GWQC) defined in N.J.A.C. 7:9-6. In the event the GWQC for a particular compound is numerically lower than the practical quantitation limit (PQL) for that compound, the PQL will be applied as the groundwater cleanup level. According to the most recent documentation from the NJDEP , the GWQC for PCE is 1.0 µg/L.

4.0 REMEDIAL ACTION ALTERNATIVES

4.1 Considered Remedial Actions

There are several technologies proven to be effective for remediating soil and groundwater contaminated with volatile organic compounds (VOCs). However, the applicability of these technologies is dependent on site-specific data, including the nature and extent of the contamination, and the geologic and hydrologic conditions. The following are brief descriptions of possible remedial alternatives based predominantly on their potential for treating VOCs. Site-specific conditions were fully considered during the selection of the best remedial alternative for Landfill M-5.

Excavation - Excavation is used to remove contaminated soils from the subsurface. Excavation can be a very effective site remedy when contamination is limited to shallow soils. Standard construction practices can excavate to a depth of 25 ft. Dewatering is required if contamination is located within the saturated zone. This is the best technology for small volumes. Excavated materials are treated either onsite or offsite, and returned to the excavation, or transported to an appropriate disposal facility. This technology only addresses soil contamination, but may be used in conjunction with other alternatives (i.e. natural attenuation) to address groundwater issues.

As mentioned in Section 1.5.1, PCE concentrations ranging from 0.320 to 3.300 mg/kg were detected in five soil samples collected from 6-inch intervals above the ground water table interface. This minor soil contamination could be attributed to vertical groundwater movement due to seasonal and tidal influences. Because these results are likely indicative of impacted seasonal groundwater rather than a soil source, the excavation remedial alternative is not suitable for Landfill M-5.

Two-Phase Vacuum Extraction - Two-Phase Vacuum Extraction (TPVE) consists of extracting contaminated ground water and soil vapors simultaneously using an array of extraction wells, separating the water and vapor phases, and passing each through a surface treatment system. The vapor phase is subsequently discharged to the atmosphere and the water phase is discharged to either the ground water, surface water, or a sanitary sewer. This technology addresses both soil and ground water contamination, and its benefits are most cost-effective when soil and groundwater concentrations are relatively high. In addition, TPVE often requires a follow-up remedial technology to further reduce contaminant concentrations to within NJDEP's regulatory limits. A pilot study must be performed to evaluate effectiveness prior to full-scale implementation.

Since PCE concentrations are relatively low at Landfill M-5, and for the reasons stated above, TPVE is not suitable for this site.

In-Situ Aeration (Air Sparging) - Air sparging treats contaminated groundwater by volatilizing organic compounds. Clean air is injected into the contaminated aquifer through vertical and/or horizontal wells. The air volatilizes the dissolved phase VOCs and transfers the contaminated vapors from the saturated zone into the unsaturated zone. The organic vapors are then extracted from the

unsaturated zone through a Soil Vapor Extraction (SVE) system and treated at a surface unit. A pilot study must be performed to evaluate effectiveness prior to full-scale implementation.

As mentioned in Section 1.2.4, ground water is typically encountered at depths of 2 to 9 feet bgs. Due to minimal thickness of the unsaturated zone, an SVE system likely could not be successfully operated. Also, the air injection into the aquifer should be performed under a rigorous control in order to prevent migration of the contamination toward the creek. Based on these factors, an air-sparging system is not suitable for Landfill M-5.

Pump and Treat - Contaminated ground water is extracted out of the ground with a system of pumping wells and is treated with an air stripper, carbon adsorption unit, or other pertinent treatment unit. Remediated water is then discharged to a ground water recharge zone, a stream, or a sanitary sewer. A pilot study must be performed to evaluate effectiveness prior to full-scale implementation. This is the most commonly used groundwater remediation technology.

As mentioned in Section 1.5.2, a decrease in PCE concentrations was noticed in all monitoring wells, except M5MW-15 and M5MW-16. Two other monitoring wells – MW-19 and MW-20 – have shown periodic increases in measured PCE concentrations, but the overall trend of these fluctuations is downward. Based on this fact and based on the aquifer pump test results (Section 1.5.4), which shows that during the pumping test drawdown recorded in the observation wells did not exceed 0.01 feet, this remedial alternative method is not suitable for Landfill M-5.

Natural Remediation - Natural remediation is a method of groundwater remediation where contaminant concentrations will decrease to applicable groundwater quality standards via degradation, retardation, or dispersion under present site conditions.

This alternative method is discussed in detail in Section 4.1.1 below.

Anaerobic Bioremediation - Biodegradation reduces contaminant mass by introducing contaminant-degrading microorganisms, or enhancing indigenous microbial activity within the contaminated area. The microorganisms convert the organic compounds to carbon dioxide, inorganic salts, and water. Bioremediation can be used in either in situ or ex situ environments. Bioremediation is a developed technology, and a variety of bioremediation systems have been used at remediation sites.

This alternative method is discussed in detail in Section 4.1.2 below.

4.1 Proposed Remedial Actions

The DPW proposes to use two corrective action remedial alternatives: natural remediation, and anaerobic bioremediation treatment. Bioremediation treatment will involve the injection of Hydrogen Release Compound (HRC) into the groundwater to increase the degradation rate of the contaminant of concern (PCE). The following sections describe the natural remediation program and the anaerobic bioremediation treatment system operation.

4.1.1 Natural Remediation

Natural remediation is a method of groundwater remediation where contaminant concentrations will decrease to applicable groundwater quality standards via degradation, retardation, or dispersion under present site conditions.

The following NJDEP requirements were factors that indicate that natural remediation is a viable course of action for this site:

- Groundwater contamination does not appear to be resulting from a specific soil source;
- Groundwater contamination at the site has been delineated;
- As mentioned in Section 1.5.2, a decrease in PCE concentrations was noticed in all monitoring wells, except M5MW-15, M5MW-16, and M8MW-12. Two other monitoring wells – MW-19 and MW-20 – have shown periodic increases in measured PCE concentrations, but the overall trend of these fluctuations is downward;
- Based upon the CEA calculation, the PCE contaminant plume will not migrate more than approximately 54 feet over a period of approximately five years:
- Mill Creek, a potential receptor, is contaminated with PCE from an off-site source; however, the on-site PCE groundwater contamination is not expected to contribute to the creek's contamination.

A groundwater monitoring/sampling program has been implemented by the DPW at the Landfill M-5 site. Three sentinel wells (M5MW-12, M5MW-13, and M5 MW-14) located along Mill Creek, and all groundwater monitoring wells at Landfill M-5 site will be sampled quarterly and the data generated will be evaluated to determine the effectiveness of natural remediation.

4.1.2 Anaerobic Bioremediation

Although PCE is expected to naturally attenuate, the DPW proposes to implement an anaerobic bioremediation system program to actively address the PCE groundwater contamination at the Landfill M-5 area.

The anaerobic bioremediation that the DPW proposes involves treatment of seven areas of concentrated chlorinated hydrocarbon contamination with Hydrogen Release Compound (HRC). HRC is a proprietary, food quality, polylactate ester that, upon being deposited into the subsurface, creates anaerobic aquifer conditions and causes the release of hydrogen. Under anaerobic conditions, naturally occurring microorganisms use the hydrogen to progressively remove chlorine atoms from chlorinated hydrocarbons via reductive dechlorination. HRC is a slow-release compound that will provide a steady hydrogen source for between six months and one year.

Design

With input from REGENESIS Bioremediation Products, the company that manufactures and markets HRC, seven areas were selected for HRC treatment. These sites are depicted on Figure 15. Placement of the treatment areas is intended to provide direct treatment of the areas of highest groundwater impact, as well as limit downgradient migration of affected groundwater.

The following assumptions were made for design purposes:

- A ten-foot thick zone of contamination will be treated with HRC.
- The HRC injection points will be located by imposing a 12 foot by 12 foot grid over each treatment area, and placing an injection point at the center of each grid square.
- HRC will be applied at a rate of 4 pounds/vertical foot.

Implementation

The HRC will be applied using direct push technology via 1.25-inch (outer diameter) Geoprobe rods. Injection points will be terminated at approximately 15 feet below surface grade. After completion of each injection point, a high-pressure pump will be used to inject the HRC compounds from bottom to top. It is assumed that between 10 to 15 HRC injection points and treatments will be performed per day.

Monitoring Program

Two weeks after the first HRC treatment is performed, a groundwater sampling event will be performed to evaluate the effectiveness of the treatment. All on site monitoring wells will be sampled and analyzed for VOC+10. After two more quarterly groundwater sampling and testing for VOCs, if a decrease in PCE concentration is reported, a second HRC treatment will be performed using the same methodology as during the first treatment. Based on the analytical results, the number of injection points in each treatment area may be modified. The effectiveness of the HRC treatment, methodologies, field activities, and analytical data will be reported to the NJDEP in quarterly progress reports.

The DPW reserves the right to revert to the natural remediation program in the event the anaerobic bioremediation program is deemed unsuccessful.

5.0 QUALITY ASSURANCE PROJECT PLAN

In order to maintain quality assurance, the DPW's SOP for Sample Handling will be followed during all sampling activities. This SOP is presented as Appendix A.

6.0 REQUIRED PERMITS

The Department of Public Works (DPW) will be responsible for obtaining the permit by rule from the NJDEP case manager prior to performing Hydrogen Release Compound (HRC) injection, using Geoprobe injection points, at Landfill M-5.

7.0 EROSION, DUST, AND ODOR CONTROL

Erosion, dust, and odor control measures are not deemed necessary due to the limited extent and duration of soil disturbance.

8.0 HEALTH AND SAFETY PLAN

The Department of Public Works (DPW) will be responsible for preparation of a site-specific Health and Safety Plan (HASP) encompassing installation of Geoprobe injection points, injection of hydrogen release compound (HRC), and groundwater sampling after bioremediation treatment.

9.0 SITE RESTORATION

All injection points drilled in order to perform chemical injection will be properly sealed by a New Jersey-licensed well sealer. The aboveground equipment (e.g. pumps. temporary structures, etc.) will be dismantled and removed from the site.

10.0 POST-REMEDIAL ACTION SAMPLING

The DPW proposes to continue monitoring Landfill M-5 with quarterly groundwater sampling events during the anaerobic bioremediation process. Once the NJDEP GWQC has been achieved for the contaminant of concern (i.e., PCE) in all related monitoring wells for three consecutive monitoring rounds, or if a decrease in PCE concentration is reported in all related monitoring wells for three consecutive monitoring rounds, the DPW proposes to discontinue the anaerobic bioremediation and conduct passive quarterly groundwater monitoring for a period of two years. The monitoring wells MW-10, MW-11, M5MW-15, M5MW-16, M5MW-18, M5MW-19, M5MW-20, M5MW-23, M5MW-25, M8MW-12, M8MW-23, and M8MW-24 and sentinel wells MW-12, MW-13, MW-14, will be sampled and analyzed for VOC+15. If the contaminant of concern remains below its GWQC for eight consecutive rounds of sampling, the DPW will apply to the NJDEP for No Further Action (NFA) status. Upon issuance of NFA status, the DPW will seal these monitoring wells.

11.0 ESTIMATED COST OF REMEDIAL ACTION WORKPLAN IMPLEMENTATION

The anticipated costs for implementing the proposed remedial action are summarized below:

REMEDIATION COSTS

- Costs for Geoprobe injection points (phase I) =$33,120
- Costs for HRC treatment (phase I) =$41,040
- Costs for Geoprobe injection points (phase II) =$33,120
- Costs for HRC treatment (phase II) =$41,040
- Cost of engineering oversight (phase I and phase II) =$28,800
- Costs for groundwater sampling two weeks after injection =$23,000
- Costs for groundwater sampling quarterly for five years =$92,000
- Costs for quarterly progress reports (20 reports) =$23,000

POST-REMEDIATION COSTS

- Costs for removal, restoration =$ 5,000
- Costs for groundwater sampling and laboratory (five years) =$92,000
- Costs for well abandonment =$20,000
- Costs for quarterly progress reports (20 reports) =$23,000

TOTAL REMEDIAL ACTION COSTS =$455,120

Notes:
Costs do not include permitting fees, NJDEP review fees, or disposal costs.
Costs assume that two bioremediation treatments will be performed.
Costs assume that remediation and post-remediation groundwater sampling will continue on a quarterly basis for two years.

12.0 PROPOSED SCHEDULE

Identification of Project Tasks:

- RAWP submittal and NJDEP approval
- Permitting for anaerobic remediation
- Anaerobic remediation
- Quarterly groundwater sampling events
- Preparation and submittal of quarterly progress reports (five years)
- Quarterly post-remedial sampling
- NJDEP approval of No Further Action

A schedule for the proposed remedial programs shown in Figure 16. If it becomes necessary to modify the schedule, the Department of Public Works (DPW) will submit a revised schedule to the New Jersey Department of Environmental Protection.

All concentrations are given in milligrams per kilogram (mg/kg), equivalent to parts per million (ppm).
NR: Sample depth not reported.
QA/QC: Quality Assurance/Quality Control.
U: Analyte undetected in this sample.
NJDEP: New Jersey Department of Environmental Protection.
IGWSCC: Impact to Ground Water Soil Cleanup Criteria.

All concentrations are given in micrograms per liter (ug/L), equivalent to parts per billion (ppb).
Concentrations exceeding the NJDEP Ground Water Quality Criteria (GWQC) are listed in bold print.
PCE: tetrachloroethene.
TCE: trichloroethene.
cis-1,2-DCE: cis-1,2-dichloroethene.

Stream Sampling Location SS-16
November 1996 - June 1999

Lab Sample ID Date	25-Nov-96	12-Dec-96	29-Jan-97	26-Feb-97	10-Mar-97	8-Apr-97	17-Jul-97	30-Oct-97	10-Feb-98	21-Apr-98	19-Aug-98	17-Nov-98	25-Feb-99	4579.12 29-Jun-99	NJDEP SWQS (ug/L)
Acetone	NA	NA	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	NLE
cis - 1,2 - Dichloroethene	NA	NA	1.30	1.27	ND	2.05	2.55	1.76	ND	ND	2.94	ND	ND	3.56	NLE
Methylene chloride	3.08	4.65	3.01	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	ND	1600
Trichloroethene (TCE)	1.86	1.00	1.14	1.20	ND	1.26	ND	ND	ND	ND	1.63	ND	ND	2.25	81
Tetrachloroethene (PCE)	**7.53**	3.82	**5.19**	**6.75**	2.31	**4.47**	**4.72**	1.86	**6.23**	**4.58**	**4.33**	1.48	**6.06**	**7.70**	4.29

Only detected compounds are listed.
All concentrations are given in micrograms per liter (ug/L), equivalent to parts per billion (ppb).
NA: Sample not analyzed for this parameter.
ND: Parameter not detected in this sample.
NLE: No regulatory limit has been established for this parameter.
SWQS: New Jersey Department of Environmental Protection Surface Water Quality Standards.
Exceedances of the NJDEP SWQS are highlighted and printed in bold-faced type.

NOTES

1. NJDEP GWQS FOR TETRACHLOROETHENE = 1 UG/L
NJDEP GWQS FOR TRICHLOROETHENE = 1 UG/L.
2. ALL MAPPED SAMPLING POINTS WERE SAMPLED, ONLY DATA FROM SAMPLING POINTS WITH EXCEEDENCES OF THE NJDEP GWQC OR RSDS ARE SHOWN
3. ONLY MONITORING WELLS THAT WERE PART OF THE MS INVESTIGATION ARE MAPPED
4. SEVERAL OTHER CONTAMINANTS WERE DETECTED AT THESE SAMPLING POINTS, AND SOME OF THE DETECTED CONTAMINANTS WERE IN EXCEEDENCE OF THE APPLICABLE NJDEP STANDARDS. HOWEVER, THESE OTHER CONTAMINANTS ARE NOT CONSIDERED TO BE OF CONCERN FOR THIS SITE. FOR A DISCUSSION OF THE OTHER CONTAMINANTS DETECTED AT THIS SITE, PLEASE SEE SECTION 1.3 OF THE BODY OF THIS REPORT

Material Safety Data Sheet for Hydrogen Release Compound®

MATERIAL SAFETY DATA SHEET

Last Revised: March 1, 2001

****

Section 1 - Material Identification

****

Supplier: Regenesis Bioremediation Products
1011 Calle Sombra
San Clemente, CA 92673
Telephone: (949) 366-8000
Facsimile: (949) 366-8090

Chemical Name: Propanoic acid, 2-[2-[2-(2-hydroxy-1-oxopropoxy)-1-oxopropoxy]

-1-oxopropoxy]-1,2,3-propanetriyl ester

Chemical Family: Organic Chemical

Trade Name: Glycerol tripolylactate

Product Name: Hydrogen Release Compound® (HRC®)

****

Section 2 - Hazardous Ingredients

****

CAS #: 201167-72-8

One should anticipate the potential for eye irritation and skin irritation with large scale exposure or in sensitive individuals.

****

Section 3 - Physical Data

****

Melting Point: NA

Boiling Point: ND

Flash Point: ND

Density: 1.347

Solubility: Acetone and DMSO

Appearance: Amber semi-solid

Odor: Not detectable

Vapor Pressure: None

****

Section 4 - Fire and Explosion Hazard Data

****

Extinguishing Media: Carbon Dioxide, Dry Chemical Powder or Appropriate Foam.

Water may be used to keep exposed containers cool.

For large quantities involved in a fire, one should wear full protective clothing and a NIOSH approved self contained breathing apparatus with full face piece operated in the pressure demand or positive pressure mode as for a situation where lack of oxygen and excess heat are present.

****

Section 5 - Toxicological Information

****

Acute Effects: May be harmful by inhalation, ingestion, or skin absorption.

May cause irritation. To the best of our knowledge, the chemical, physical, and toxicological properties of the glycerol tripolylactate have not been investigated. Listed below are the toxicological information for glycerol and lactic acid.

RTECS#: MA8050000

Glycerol

Irritation data: SKN-RBT 500 MG/24H MLD 85JCAE-,207,1986

EYE-RBT 126 MG MLD BIOFX* 9-4/1970

EYE-RBT 500 MG/24H MLD 85JCAE-,207,1986

Toxicity data: ORL-MUS LD50:4090 MG/KG FRZKAP (6),56,1977

SCU-RBT LD50:100 MG/KG NIIRDN 6,215,1982

ORL-RAT LD50:12600 MG/KG FEPRA7 4,142,1945

IHL-RAT LC50: >570 MG/M3/1H BIOFX* 9-4/1970

IPR-RAT LD50: 4420 MG/KG RCOCB8 56,125,1987

IVN-RAT LD50:5566 MG/KG ARZNAD 26,1581,1976

IPR-MUS LD50: 8700 MG/KG ARZNAD 26,1579,1978

SCU-MUS LD50:91 MG/KG NIIRDN 6,215,1982

IVN-MUS LD50: 4250 MG/KG JAPMA8 39,583,1950

ORL-RBT LD50: 27 GM/KG DMDJAP 31,276,1959

SKN-RBT LD50:>10GM/KG BIOFX* 9-4/1970

IVN-RBT LD50: 53 GM/KG NIIRDN 6,215,1982

ORL-GPG LD50: 7750 MG/KG JIHTAB 23,259,1941

Target Organ data: Behavioral (headache), gastrointestinal (nausea or vomiting), Paternal effects (spermatogenesis, testes, epididymis, sperm duct), effects of fertility (male fertility index, post-implantation mortality).

RTECS#: OD2800000

Lactic acid

Irritation data: SKN-RBT 5MG/24H SEV 85JCAE -,656,86

EYE-RBT 750 UG SEV AJOPAA 29,1363,46

Toxicity data: ORL-RAT LD50:3543 MG/KG FMCHA2-,C252,91

SKN-RBT LD50:>2 GM/KG FMCHA2-,C252,91

ORL-MUS LD50: 4875 MG/KG FAONAU 40,144,67

ORL-GPG LD50: 1810 MG/KG JIHTAB 23,259,41

ORL-QAL LD50: >2250 MG/KG FMCHA2-,C252,91

Only selected registry of toxic effects of chemical substances (RTECS) data is presented here. See actual entry in RTECS for complete information on lactic acid and glycerol.

****

Section 6 - Health Hazard Data

****

Handling: Avoid continued contact with skin.

Avoid contact with eyes.

In any case of any exposure which elicits a response, a physician should be consulted immediately.

First Aid Procedures:

Inhalation: Remove to fresh air. If not breathing give artificial respiration. In case of labored breathing give oxygen. Call a physician.

Ingestion: No effects expected. Do not give anything to an unconscious person. Call a physician immediately.

Skin Contact: Flush with plenty of water. Contaminated clothing may be washed or dry cleaned normally.

Eye contact: Wash eyes with plenty of water for at least 15 minutes lifting both upper and lower lids. Call a physician.

****

Section 7 - Reactivity Data

****

Conditions to Avoid: Strong oxidizing agents, bases and acids

Hazardous Polymerization: None known

Further Information: Hydrolyses in water to form Lactic Acid and Glycerol.

****

Section 8 - Spill, Leak or Accident Procedures

****

After Spillage or Leakage: Neutralization is not required. This combustible material may be burned in a chemical incinerator equipped with an afterburner and scrubber.

Disposal: Laws and regulations for disposal vary widely by locality. Observe all applicable regulations and laws. This material, may be disposed of in solid waste. Material is readily degradable and hydrolyses in several hours.

No requirement for a reportable quantity (CERCLA) of a spill is known.

****

Section 9 - Special Protection or Handling

****

Should be stored in plastic lined steel, plastic, glass, aluminum, stainless steel, or reinforced fiberglass containers.

Protective Gloves: Vinyl or Rubber

Eyes: Splash Goggles or Full Face Shield

Area should have approved means of washing

eyes.

Ventilation: General exhaust.

Storage: Store in cool, dry, ventilated area.

Protect from imcompatible materials.

****

Section 10 - Other Information

****

This material will degrade in the environment by hydrolysis to lactic acid and glycerol.

Materials containing reactive chemicals should be used only by personnel with appropriate chemical training.

The information contained in this document is the best available to the supplier as of the time of writing. Some possible hazards have been determined by analogy to similar classes of material. No separate tests have been performed on the toxicity of this material. The items in this document are subject to change and clarification as more information becomes available.

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEP CERTIFICATION # 13461

Definition of Qualifiers

MDL	**:**	**Method Detection Limit**
J	**:**	**Compound identified below detection limit**
B	**:**	**Compound found in blank**
D	**:**	**Results are from a dilution of the sample**
U	**:**	**Compound searched for but not detected**
E	**:**	**Compound exceeds calibration limit**
PQL	**:**	**Practical Quantitation Limit**
NLE	**:**	**No limit established**
RT	**:**	**Retention time**

METHODOLOGY SUMMARY

PARAMETER	REFERENCE
TARGET ANALYTE LIST METALS	Standard Methods, 18th ed.
Aluminum	3120B
Antimony	3120B
Arsenic	3120B
Barium	3120B
Beryllium	3120B
Cadmium	3120B
Calcium	3120B
Chromium	3120B
Cobalt	3120B
Copper	3120B
Iron	3120B
Lead	3120B
Magnesium	3120B
Manganese	3120B
Mercury	3112B
Nickel	3120B
Potassium	3120B
Selenium	3120B
Silver	3120B
Sodium	3120B
Thallium	3120B
Vanadium	3120B
Zinc	3120B

PARAMETER	REFERENCE
TARGET COMPOUND LIST ORGANICS	Federal Register 40 CFR Part 136 Appendix A
Base/Neutral and Acid Extractables by GC/MS	625
Purgeable Organics by GC/MS	624
Pesticide and PCB by GC	608

NJDEP Laboratory Certification # 13461

6-4-03

Daniel Wright/Date
Laboratory Director

METHODOLOGY SUMMARY

PARAMETER	REFERENCE
TARGET ANALYTE LIST METALS	Standard Methods, 18th ed.
Aluminum	3120B
Antimony	3120B
Arsenic	3120B
Barium	3120B
Beryllium	3120B
Cadmium	3120B
Calcium	3120B
Chromium	3120B
Cobalt	3120B
Copper	3120B
Iron	3120B
Lead	3120B
Magnesium	3120B
Manganese	3120B
Mercury	3112B
Nickel	3120B
Potassium	3120B
Selenium	3120B
Silver	3120B
Sodium	3120B
Thallium	3120B
Vanadium	3120B
Zinc	3120B

PARAMETER	REFERENCE
TARGET COMPOUND LIST ORGANICS	Federal Register 40 CFR Part 136 Appendix A
Base/Neutral and Acid Extractables by GC/MS	625
Purgeable Organics by GC/MS	624
Pesticide and PCB by GC	608

DEPTH TO WATER: 10.60 ft
DEPTH OF WELL: 19.94 ft
DEPTH TO TOP OF SCREEN: N/A ft
HEIGHT OF WATER: 9.34 ft
(9.34) X .65 X 3 =18.21
GALLONS OF H_2O TO BE PURGED: 18 gal
PURGE METHOD: (FLOW OF <0.5 TO >5.0 gpm) PERISTALTIC
PURGE RATE: 0.23 gpm
Hnu READING: 0.0 ppm

PURGE START TIME: 08:40
pH 4.93 su — TEMP 11.03 °C
DISSOLVED O_2 4.32 mg/L — SPECIFIC CONDUCTIVITY 463.7 ms/cm

PURGE END TIME: 09:58
pH 4.80 su — TEMP 10.98 °C
DISSOLVED O_2 1.76 mg/L — SPECIFIC CONDUCTIVITY 454.1 ms/cm

DEPTH TO H_2O AFTER PURGE AND BEFORE SAMPLING: 10.71 ft
(SAMPLING METHOD: DEDICATED (LAW NJDEP FSPM 1992) TEFLON ® BAILER)
TOTAL VOLUME PURGED: 18 gal

SAMPLE START TIME: 09:59
pH 4.78 su — TEMP 10.99 °C
DISSOLVED O_2 1.75 mg/L — SPECIFIC CONDUCTIVITY 455.2 ms/cm

SAMPLE END TIME: 10:02

COMMENTS: Low draw down.

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEP CERTIFICATION # 13461

Definition of Qualifiers

MDL	**:**	**Method Detection Limit**
J	**:**	**Compound identified below detection limit**
B	**:**	**Compound found in blank**
D	**:**	**Results are from a dilution of the sample**
U	**:**	**Compound searched for but not detected**
E	**:**	**Compound exceeds calibration limit**
PQL	**:**	**Practical Quantitation Limit**
NLE	**:**	**No limit established**
RT	**:**	**Retention time**

Date Acquired	**28-Apr-03**	Sample Multiplier	**1**

CAS#	Name	R.T.	Response	Result	Regulatory Level (ug/L)*	MDL	RL		Qualifier
110-86-1	Pyridine			not detected	NLE	0.69	10.00	ug/L	
62-75-9	N-nitroso-dimethylamine			not detected	20	0.52	10.00	ug/L	
62-53-3	Aniline			not detected	NLE	1.66	10.00	ug/L	
108-95-2	Phenol			not detected	4000	0.59	10.00	ug/L	
111-44-4	bis(2-Chloroethyl)ether			not detected	10	0.55	10.00	ug/L	
95-57-8	2-Chlorophenol			not detected	40	1.52	10.00	ug/L	
541-73-1	1,3-Dichlorobenzene			not detected	600	0.94	10.00	ug/L	
106-46-7	1,4-Dichlorobenzene			not detected	75	0.81	10.00	ug/L	
100-51-6	Benzyl alcohol			not detected	NLE	0.97	10.00	ug/L	
95-50-1	1,2-Dichlorobenzene			not detected	600	0.83	10.00	ug/L	
95-48-7	2-Methylphenol			not detected	NLE	1.45	10.00	ug/L	
39638-32-9	bis(2-chloroisopropyl)ether			not detected	300	0.70	10.00	ug/L	
106-44-5	4-Methylphenol			not detected	NLE	1.61	10.00	ug/L	
621-64-7	n-Nitroso-di-n-propylamine			not detected	20	0.70	10.00	ug/L	
67-72-1	Hexachloroethane			not detected	10	0.83	10.00	ug/L	
98-95-3	Nitrobenzene			not detected	10	0.64	10.00	ug/L	
78-59-1	Isophorone			not detected	100	0.57	10.00	ug/L	
88-75-5	2-Nitrophenol			not detected	NLE	1.16	10.00	ug/L	
105-67-9	2,4-Dimethylphenol			not detected	100	1.52	10.00	ug/L	
111-91-1	bis(2-Chloroethoxy)methane			not detected	NLE	0.77	10.00	ug/L	
120-83-2	2,4-Dichlorophenol			not detected	20	1.63	10.00	ug/L	
65-85-0	Benzoic Acid			not detected	NLE	0.72	10.00	ug/L	
120-82-1	1,2,4-Trichlorobenzene			not detected	9	0.84	10.00	ug/L	
91-20-3	Naphthalene			not detected	NLE	0.67	10.00	ug/L	
106-47-8	4-Chloroaniline			not detected	NLE	1.67	10.00	ug/L	
87-68-3	Hexachlorobutadiene			not detected	1	0.85	10.00	ug/L	
59-50-7	4-Chloro-3-methylphenol			not detected	NLE	1.38	10.00	ug/L
