191-24-2	Benzo[g,h,i]perylene			not detected	NLE	1.24	10.00	ug/L	

* Higher of PQL's and Ground Water Criteria as per NJAC 7:9-6 2-Sept-97

Qualifiers

E= Value Exceeds Linear Range
D= Value from dilution
B= Compound in Related Blank
MDL= Method Detection Limit
NLE= No Limit Established
R.T.=Retention Time
RL= Reporting Limit. The values between the MDL and RL are considered estimated.

Ft. Monmouth, NJ 07703

Lab ID #: 3018003
Sample Received: 04/21/03
Sample Matrix: Aqueous

Site: M5
Ft. Monmouth, New Jersey

Field ID#: Dupe

Method of Digestion: E.P.A SW-846, Method 3015A
Method of Analysis: Std. Methods 18th, Method 3120B, 3112B

TAL-METALS RESULTS SUMMARY (ug/L)

Element	Date of Analysis	Result (ug/L)	Regulatory Level (ug/L)*	R.L. (ug/L)	MDL (ug/L)
Aluminum	05/20/03	1140	200	100	10.0
Antimony	05/20/03	ND	20	10	2.0
Arsenic	05/20/03	10.5	8	5.0	2.0
Barium	05/20/03	14.0	2000	10	0.5
Beryllium	05/20/03	ND	20	0.25	0.5
Cadmium	05/20/03	1.58	4	1.0	0.5
Calcium	05/20/03	8620	NLE	100	20.0
Chromium	05/20/03	12.5	100	10	0.5
Cobalt	05/20/03	ND	NLE	5.0	0.5
Copper	05/20/03	ND	1000	10	2.0
Iron	05/20/03	29700	300	200	10.0
Lead	05/20/03	ND	10	5.0	1.0
Magnesium	05/20/03	1980	NLE	100	10.0
Manganese	05/20/03	20.3	50	5.0	0.5
Mercury	05/15/03	ND	2	0.20	0.15
Nickel	05/20/03	ND	100	5.0	1.0
Potassium	05/20/03	3020	NLE	200	40.0
Selenium	05/20/03	ND	50	10	3.0
Silver	05/20/03	ND	20	5.0	1.0
Sodium	05/20/03	61200	50000	200	20.0
Thallium	05/20/03	ND	10	10	2.0
Vanadium	05/20/03	ND	NLE	5.0	0.5
Zinc	05/20/03	12.6	5000	500	5.0

ND = Not Detected, MDL = Method Detection Limit, NLE = No Limit Established
* Higher of PQL's and Ground Water Quality Criteria as per N.J.A.C. 7:9-6
R.L= Reporting limit. Note: The results reported between MDL and RL are estimated.

Report of Analysis
U.S. Army, Fort Monmouth Environmental Laboratory

METHODOLOGY SUMMARY

PARAMETER	REFERENCE
TARGET ANALYTE LIST	Standard Methods, 18th ed.
Aluminum	3120B
Antimony	3120B
Arsenic	3120B
Barium	3120B
Beryllium	3120B
Cadmium	3120B
Calcium	3120B
Chromium	3120B
Cobalt	3120B
Copper	3120B
Iron	3120B
Lead	3120B
Magnesium	3120B
Manganese	3120B
Mercury	3112B
Nickel	3120B
Potassium	3120B
Selenium	3120B
Silver	3120B
Sodium	3120B
Thallium	3120B
Vanadium	3120B
Zinc	3120B
TARGET COMPOUND LIST	Federal Register 40 CFR Part 136 Appendix A
Base/Neutrals and Acid Extractables by GC/MS	625
Purgeable Organcis by GC/MS	624
Pesticides and PCB's by GC	608

SAMPLE START TIME: 09:49
pH 5.72 su — TEMP 20.12 °C
DISSOLVED O_2 1.15 mg/L — SPECIFIC CONDUCTIVITY 267 µs/cm

SAMPLE END TIME: 09:52

COMMENTS: Low draw down. Cloudy, orange and yellow. MS/MSD here.

U.S. ARMY FORT MONMOUTH
MONITORING WELL SAMPLING DATA

LOCATION: M5
MW#: 00M5MW25
NJDEP ID #: 29-40126
NJDEP CERT #: 13461
SAMPLING CONTRACTOR: TVS
SAMPLER: Corey McCormack
DATE: 07/30/03
WEATHER: Sunny and warm.
TIDE: Low

LNAPLs: N
DNAPLs N
ELEV. OF INNER CASING SURVEY MARK: N/A ft
INNER CASING DIA.: 4" INCH
DEPTH TO WATER: 11.73 ft
DEPTH OF WELL: 19.94 ft
DEPTH TO TOP OF SCREEN: N/A ft
HEIGHT OF WATER: 8.21 ft
(8.21) X .65 X 3 =16.00
GALLONS OF H_2O TO BE PURGED: 16 gal
PURGE METHOD: (FLOW OF <0.5 TO >5.0 gpm) PERISTALTIC
PURGE RATE: 0.23 gpm
Hnu READING: 0.0 ppm

PURGE START TIME: 07:31
pH 5.04 su — TEMP 16.87 °C
DISSOLVED O_2 4.11 mg/L — SPECIFIC CONDUCTIVITY 934 µs/cm

PURGE END TIME: 08:40
pH 4.89 su — TEMP 16.42 °C
DISSOLVED O_2 2.24 mg/L — SPECIFIC CONDUCTIVITY 937 µs/cm

DEPTH TO H_2O AFTER PURGE AND BEFORE SAMPLING: 11.85 ft
(SAMPLING METHOD: DEDICATED (LAW NJDEP FSPM 1992) TEFLON ® BAILER)
TOTAL VOLUME PURGED: 16 gal

SAMPLE START TIME: 08:41
pH 4.90 su — TEMP 16.43 °C
DISSOLVED O_2 2.23 mg/L — SPECIFIC CONDUCTIVITY 936 µs/cm

SAMPLE END TIME: 08:46

COMMENTS: Low draw down. DUP. Here.

* Higher of PQL's and Ground Water Criteria as per NJAC 7:9-6 2-Sept-97

Qualifiers

E= Value Exceeds Linear Range
D= Value from dilution
B= Compound in Related Blank
MDL= Method Detection Limit
NLE= No Limit Established
R.T.=Retention Time
RL= Reporting Limit. The values between the MDL and RL are considered estimated.

MDL = Method Detection Limit.
ND =Not Decteded / Below MDL.
B = Present in the associated Blank.
E = Exceeded Calibration Range, Dilution to follow.
D = Dilution.
NLE = No Limit Established.
RL = Reporting Limit.
PQL = Practical Quantitation Limit.

Initial Vol.(ml) 1000.0
Final Vol.(ml) 10.0

*Higher of PQL's and ground water criteria as per NJAC 7:9-6
*Results between MDL and RL are estimated.
Column-Primary: Rtx-CLPesticides 30/.32mm ID/.25um.
Column-Confirmation: Rtx-CLPesticides2 30m/.32mm ID/.5um.

VOLATILE ORGANICS

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEP CERTIFICATION # 13461

Definition of Qualifiers

MDL	:	Method Detection Limit
J	:	Compound identified below detection limit
B	:	Compound found in blank
D	:	Results are from a dilution of the sample
U	:	Compound searched for but not detected
E	:	Compound exceeds calibration limit
PQL	:	Practical Quantitation Limit
NLE	:	No limit established
RT	:	Retention time

VOLATILE ORGANICS

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEP CERTIFICATION # 13461

Definition of Qualifiers

MDL	:	**Method Detection Limit**
J	:	**Compound identified below detection limit**
B	:	**Compound found in blank**
D	:	**Results are from a dilution of the sample**
U	:	**Compound searched for but not detected**
E	:	**Compound exceeds calibration limit**
PQL	:	**Practical Quantitation Limit**
NLE	:	**No limit established**
RT	:	**Retention time**

Volatile Analysis Report
U.S. Army, Fort Monmouth Environmental Laboratory

CAS#	Compound Name	R.T.	Response	Result	Regulatory Level (ug/l)*	MDL	RL	Qualifiers
107028	Acrolein			not detected	780	1.85 ug/L	20.00 ug/L	
107131	Acrylonitrile			not detected	0.67	2.78 ug/L	20.00 ug/L	
75650	tert-Butyl alcohol			not detected	nle	8.52 ug/L	20.00 ug/L	
1634044	Methyl-tert-Butyl ether			not detected	nle	0.16 ug/L	2.00 ug/L	
108203	Di-isopropyl ether			not detected	nle	0.25 ug/L	2.00 ug/L	
75718	Dichlorodifluoromethane			not detected	nle	1.68 ug/L	2.00 ug/L	
74-87-3	Chloromethane			not detected	Reserved	1.16 ug/L	2.00 ug/L	
75-01-4	Vinyl Chloride			not detected	525	1.06 ug/L	2.00 ug/L	
74-83-9	Bromomethane			not detected	4000	1.10 ug/L	2.00 ug/L	
75-00-3	Chloroethane			not detected	nle	1.01 ug/L	2.00 ug/L	
75-69-4	Trichlorofluoromethane			not detected	nle	0.50 ug/L	2.00 ug/L	
75-35-4	1,1-Dichloroethene			not detected	nle	0.24 ug/L	2.00 ug/L	
67-64-1	Acetone			not detected	nle	1.36 ug/L	2.00 ug/L	
75-15-0	Carbon Disulfide			not detected	nle	0.46 ug/L	2.00 ug/L	
75-09-2	Methylene Chloride			not detected	1600	0.24 ug/L	2.00 ug/L	
156-60-5	trans-1,2-Dichloroethene			not detected	nle	0.16 ug/L	2.00 ug/L	
75-34-3	1,1-Dichloroethane			not detected	nle	0.12 ug/L	2.00 ug/L	
108-05-4	Vinyl Acetate			not detected	nle	0.78 ug/L	2.00 ug/L	
78-93-3	2-Butanone			not detected	nle	0.62 ug/L	2.00 ug/L	
156-59-2	cis-1,2-Dichloroethene			not detected	nle	0.17 ug/L	2.00 ug/L	
67-66-3	Chloroform			not detected	470	0.30 ug/L	2.00 ug/L	
71-55-6	1,1,1-Trichloroethane			not detected	nle	0.23 ug/L	2.00 ug/L	
56-23-5	Carbon Tetrachloride			not detected	6.31	0.47 ug/L	2.00 ug/L	
71-43-2	Benzene			not detected	71	0.23 ug/L	2.00 ug/L	
107-06-2	1,2-Dichloroethane			not detected	99	0.18 ug/L	2.00 ug/L	
79-01-6	Trichloroethene			not detected	81	0.23 ug/L	2.00 ug/L	
78-87-5	1,2-Dichloropropane			not detected	nle	0.40 ug/L	2.00 ug/L	
124-48-1	Bromodichloromethane			not detected	22	0.55 ug/L	2.00 ug/L	
110-75-8	2-Chloroethyl vinyl ether			not detected	nle	0.65 ug/L	2.00 ug/L	
10061-01-5	cis-1,3-Dichloropropene			not detected	nle	0.69 ug/L	2.00 ug/L	
108-10-1	4-Methyl-2-Pentanone			not detected	nle	0.59 ug/L	2.00 ug/L	
108-88-3	Toluene			not detected	200000	0.37 ug/L	2.00 ug/L	
10061-02-6	trans-1,3-Dichloropropene			not detected	1700	0.87 ug/L	2.00 ug/L	
79-00-5	1,1,2-Trichloroethane			not detected	nle	0.48 ug/L	2.00 ug/L	
127-18-4	Tetrachloroethene			not detected	4.29	0.32 ug/L	2.00 ug/L	
591-78-6	2-Hexanone			not detected	nle	0.71 ug/L	2.00 ug/L	
124-48-1	Dibromochloromethane			not detected	nle	0.86 ug/L	2.00 ug/L	
108-90-7	Chlorobenzene			not detected	21000	0.39 ug/L	2.00 ug/L	
100-41-4	Ethylbenzene			not detected	27900	0.65 ug/L	2.00 ug/L	
1330-20-7	m+p-Xylenes			not detected	nle	1.14 ug/L	4.00 ug/L	
95-47-6	o-Xylene			not detected	nle	0.62 ug/L	2.00 ug/L	
100-42-5	Styrene			not detected	nle	0.56 ug/L	2.00 ug/L	
75-25-2	Bromoform			not detected	360	0.70 ug/L	2.00 ug/L	
79-34-5	1,1,2,2-Tetrachloroethane			not detected	nle	0.47 ug/L	2.00 ug/L	
541-73-1	1,3-Dichlorobenzene			not detected	22200	0.55 ug/L	2.00 ug/L	
106-46-7	1,4-Dichlorobenzene			not detected	3159	0.57 ug/L	2.00 ug/L	
95-50-1	1,2-Dichlorobenzene			not detected	16500	0.64 ug/L	2.00 ug/L	

*Results between MDL and RL are estimated values

METHODOLOGY SUMMARY

PARAMETER	REFERENCE
TARGET ANALYTE LIST METALS	Standard Methods, 18th ed.
Aluminum	3120B
Antimony	3120B
Arsenic	3120B
Barium	3120B
Beryllium	3120B
Cadmium	3120B
Calcium	3120B
Chromium	3120B
Cobalt	3120B
Copper	3120B
Iron	3120B
Lead	3120B
Magnesium	3120B
Manganese	3120B
Mercury	3112B
Nickel	3120B
Potassium	3120B
Selenium	3120B
Silver	3120B
Sodium	3120B
Thallium	3120B
Vanadium	3120B
Zinc	3120B

PARAMETER	REFERENCE
TARGET COMPOUND LIST ORGANICS	Federal Register 40 CFR Part 136 Appendix A
Base/Neutral and Acid Extractables by GC/MS	625
Purgeable Organics by GC/MS	624
Pesticide and PCB by GC	608

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEP CERTIFICATION # 13461

Definition of Qualifiers

MDL	:	**Method Detection Limit**
J	:	**Compound identified below detection limit**
B	:	**Compound found in blank**
D	:	**Results are from a dilution of the sample**
U	:	**Compound searched for but not detected**
E	:	**Compound exceeds calibration limit**
PQL	:	**Practical Quantitation Limit**
NLE	:	**No limit established**
RT	:	**Retention time**

Report of Analysis
NJDEP Certification # 13461
EPA Method 608
PESTICIDES/PCB

Client: U.S. Army, DPW, SELFM-PW-EV
Project Name: Streams, 2nd Qrtr. '03
Field ID: SS# 28
Lab ID: 3024726
Filename: 01412B.D
Lab Project : 30247

Location: Streams, 2nd Qrtr. '03
MATRIX: Aqueous
Ext. Batch: 052703
Date Extracted: 5/27/2003
Date Analyzed: 03-Jun-03
Dilution: 1
Analyst: A.A.

VOLATILE ORGANICS

US ARMY FT. MONMOUTH ENVIRONMENTAL LABORATORY
NJDEP CERTIFICATION # 13461

Definition of Qualifiers

U: The compound was analyzed for but not detected.

B: Indicates that the compound was found in the associated method blank as well as in the sample.

J: Indicates an estimated value. This flag is used:

(1) When the mass spec and retention time data indicate the presence of a compound however the result is less than the MDL but greater than zero.

(2) When estimating the concentration of a tentatively identified compound (TIC), where a 1:1 response is assumed.

D: This flag is used to identify all compounds (target or TIC) that required a dilution.

E: Indicates the compound's concentration exceeds the calibration range of the instrument for that specific analysis.

N: This flag is only used for TICs. It indicates the presumptive evidence of a compound. For a generic characterization of a TIC, such as unknown hydrocarbon, the flag is not used.

EXECUTIVE SUMMARY

To demonstrate compliance equivalence of the existing soil cover over the M-5 Landfill Site with respect to the Solid Waste Disposal Act of 1965, DPW characterized the near-surface soils using 254 borings installed at strategic locations over the site. DPW performed soil borings and obtained soil samples between April1998 and August 1998. All soil samples were analyzed for Target Compound List (TCL) Organics + 30 parameters and Target Analyte List (TAL) metals. The data that exceeded the laboratory method detection limit (MDL) and/or the New Jersey Department of Environmental Protection (NJDEP) Residential Direct Contact Soil Cleanup Criteria (RDCSCC) are summarized in table form in this RIR. Where applicable and appropriate, the data were evaluated utilizing the "compliance averaging" approach to determine compliance with NJDEP RDCSCC.

Concentrations of VOCs, SVOCs, pesticides and PCBs and metals were detected exceeding the NJDEP RDCSCC. In all cases, further analysis of the analytical results did not define a "source area" or level of contamination that necessitated the identification and evaluation of potential remedial actions. In most cases, either the calculated compliance average was below the respective RDCSCC or the exceedence was considered marginal. However, to address the exceedences of analytes that did not meet cleanup criteria in the near surface soils, the DPW will incorporate a document equivalent to a Declaration of Environmental Restriction (DER) into the Fort Monmouth Master Plan for soils at the site. The Army is requesting a ***No Further Action*** determination for these parameters. The DER equivalent may be developed for the entire M-5 Landfill Site or be restricted to specific areas of the site and specific analytes, as identified in this document.

Given the inactive and undisturbed status of the landfill, the continued performance of long-term surface water and groundwater monitoring proximate to the M-5 Landfill Site, the minimal potential for environmental and/or human health impacts, the lack of groundwater uses at or downgradient of the site, and the distribution, occurrence and relatively low concentrations of contaminants of concern (COCs), ***No Further Action*** is recommended for the near-surface soils at the M-5 Landfill Site.

1.0 INTRODUCTION

Versar, Inc. (Versar) has been contracted by the United States (U.S.) Army Fort Monmouth, Directorate of Public Works (DPW), Fort Monmouth, New Jersey to prepare a Remedial Investigation Report (RIR) for the M-5 Landfill Site. The M-5 Landfill Site is located on the western portion of the Main Post of Fort Monmouth. This RIR presents a compilation of the results of remedial investigation conducted at the M-5 Landfill Site for near-surface soils and has been prepared in partial fulfillment of Contract No. DACA 51-00-D-004, Delivery Order No. 0004.

1.1 Objectives

The objective of this RIR is to define shallow soil conditions at the M-5 Landfill Site as proposed in DPW's letter, dated July 7, 1998 and approved by the NJDEP in correspondence dated August 10, 1998 (**Appendix A** and **Appendix B**). The remedial investigation was conducted in accordance with NJDEP Technical Requirements for Site Remediation (July 1999), NJAC 7:26E, et seq.

The remedial investigation and subsequent preparation of the RIR encompassed the following:

- Characterization of shallow subsurface soils through soil sampling and laboratory analysis.
- Comparison of the soil sample analytical results with the NJDEP RDCSC.
- Evaluation of each of the analytes found to exceed the RDCSCC using the compliance averaging approach and discussion of site-specific conditions.

1.2 Report Organization

This report is organized to minimize repetition. The findings of the Roy F. Weston, Inc. (Weston) report entitled, *Site Investigation, Fort Monmouth, New Jersey, Main Post and Charles Wood Areas, Site Investigation Report* (December 1995), were used as the basis for this remedial investigation program. **Section 2.0** provides background information and a general description of the M-5 Landfill Site located at Fort Monmouth. **Section 3.0** describes and summarizes the soil sampling activities conducted at the M-5 Landfill Site. **Section 4.0** presents the soil sample analytical results and compliance analysis**.** The sample collection information, sample results and analyses presented in this RIR were incorporated into a proprietary relational database designed to manage sample data and eliminate errors in cross-referencing information between data tables in this section. Recommendations are presented in **Section 5.0**. References used to prepare this report are listed in **Section 6.0**.

2.0 SITE BACKGROUND AND ENVIRONMENTAL SETTING

The following sections describe the site background and environmental setting of the area surrounding Fort Monmouth and the M-5 Landfill Site. Included is a description of the site location, history, current conditions and environmental setting.

2.1 Site Location and Description

Fort Monmouth is located in the central-eastern portion of New Jersey in Monmouth County, approximately 45 miles south of New York City and 70 miles northeast of Philadelphia (**Figure 2-1**). In addition to the Main Post, the installation includes two subposts, the Charles Wood Area and the Evans Area. The Main Post encompasses approximately 2540 acres and is generally bounded by State Highway 35, Parkers Creek, Lafetra Creek, the New Jersey Transit Railroad and a residential area to the south. The post was established in 1918 during World War I (WWI) as an Army Signal Corps training center. The Main Post currently provides administrative, training, and housing support functions, as well as providing many of the community facilities for Fort Monmouth. The primary mission of Fort Monmouth is to provide command, administrative, and logistical support for Headquarters, U.S. Army Communications and Electronics Command (CECOM). CECOM is a major subordinate command of the U.S. Army Materiel Command (AMC) and is the host tenant at Fort Monmouth.

The M-5 Landfill was a former historic fill site located on the northwest corner of the intersection of North Drive and Wilson Avenue and is bordered by Mill Creek and Parkers Creek to the west in the Main Post Area. The historic fill reportedly contained automobiles as well as for domestic and industrial wastes. The approximate size of the M-5 Landfill Site area is 138,200 feet^2 (3.2 acres). Based on historical research, the period of operation of the fill site was approximately 1952 to 1959.

2.2 Site Background

The U.S. Army Corps of Engineers (USACE), Baltimore District, initially contracted Roy F. Weston, Inc. (Weston) to perform a field investigation at Fort Monmouth, New Jersey. This investigation was conducted at two separate areas of Fort Monmouth, the Main Post and the Charles Wood areas. Suspected hazardous waste sites were initially identified at Fort Monmouth in a report prepared by the U.S. Army Toxic and Hazardous Materials Agency (USATHAMA, 1980). The USATHAMA report identified 37 sites with known or suspected waste materials on the Main Post and the two subposts (Charles Wood and Evans Area). A background investigation was conducted by Weston of the 37 sites and eight additional sites that were identified by Fort Monmouth and the NJDEP. Weston's findings were described in a report titled, *Investigation of Suspected Hazardous Waste Sites at Fort Monmouth, New Jersey* (1993). In this background report, additional investigations (including sampling and other field work) were recommended at 22 of the sites on the Main Post and Charles Wood areas, including the M-5 Landfill Site. NJDEP

approved the recommendations on April 20, 1995. Additional investigations were also recommended at the Evans Area, and such investigations are being completed under the Base Realignment and Closure (BRAC) program.

The 1995 Weston SI report presents the results of field investigation activities that were performed at 13 sites at the Main Post Area and eight sites at the Charles Wood Area. The results of the investigation of the M-5 Landfill Site are included in the Weston SI report. Initial field investigation activities were performed between November 1994 and March 1995. The field investigation activities included groundwater monitoring well installation and sampling. The Weston SI report was used as the basis for the supplemental remedial investigations described in the following sections of this report.

Lithologic data collected from the soil borings indicated that the overburden material consisted of a thin soil cover, approximately 0.5 feet, overlaying fill material consisting of coal, glass and plastic fragments intermixed with a silty sand and clay matrix.

2.3 Environmental Setting

The following is a description of the geological/hydrogeological setting of the area surrounding the M-5 Landfill Site. Included is a description of the regional geology of the area surrounding Fort Monmouth, as well as descriptions of the local geology and hydrogeology of the Main Post Area.

2.3.1 Regional and Local Geology

Monmouth County lies within the New Jersey Section of the Atlantic Coastal Plain physiographic province. The M-5 Landfill Site is located in what is referred to as the Outer Coastal Plain subprovince, or the Outer Lowlands. The geologic map of New Jersey is provided as **Figure 2-2**.

In general, New Jersey Coastal Plain formations consist of a seaward-dipping wedge of unconsolidated deposits of clay, silt, sand and gravel. These formations typically strike northeast-southwest with a dip ranging from 10 to 60 feet per mile and were deposited on Precambrian and lower Paleozoic rocks (Zapecza, 1989). These sediments, predominantly derived from deltaic, shallow marine and continental shelf environments, date from Cretaceous through the Quaternary Periods. The mineralogy ranges from quartz to glauconite.

The formations record several major transgressive/regressive cycles and contain units, which are generally thicker to the southeast and reflect a deeper water environment. More than 20 regional geologic units are present within the sediments of the Coastal Plain. Regressive, upward coarsening deposits are usually aquifers (e.g., Englishtown and Kirkwood Formations and the Cohansey Sand), while the transgressive deposits act as confining units (e.g., the Merchantville, Marshalltown and Navesink Formations). The individual thickness for these units varies greatly (e.g., from several feet to several hundred feet). The Coastal Plain deposits thicken to the southeast from the Fall Line

(e.g., a boundary zone between older, resistant rocks and younger, softer plain sediments) to greater than 6,500 feet in Cape May County (Brown and Zapecza, 1990).

Based on the regional geologic map (Jablonski, 1968), the Cretaceous age Red Bank and Tinton Sands outcrop at the Main Post area. The Red Bank Sand conformably overlies the Navesink Formation and dips to the southeast at 35 feet per mile. The upper member (Shrewsbury) of the Red Bank Sand is a yellowish-gray to reddish brown clayey, medium-to-coarse-grained sand that contains abundant rock fragments, minor mica and glauconite (Jablonski). The lower member (Sandy Hook) is a dark gray to black, medium-to-fine grained sand with abundant clay, mica and glauconite.

The Tinton Sand conformably overlies the Red Bank Sand and ranges from a clayey medium to very coarse-grained feldspathic-quartz and glauconite-sand to a glauconitic-coarse sand. The color varies from dark yellowish orange or light brown to moderate brown and from light olive to grayish olive. Glauconite may constitute 60 to 80 percent of the sand fraction in the upper part of the unit. The upper part of the Tinton is often highly oxidized and iron oxide encrusted (Minard, 1969). Groundwater occurs beneath the site at a depth of approximately 2 to 12 feet bgs.

The Kirkwood Formation (part of the Kirkwood-Cohansey system) crops out southeast of the Main Post and dips to the southeast at a slope of 20 feet per mile (Jablonski, 1968). The Kirkwood Formation consists of alternating layers of sand and clay. The upper unit is a light gray to yellowish-brown, fine-grained quartz sand with quartz nodules and small pebbles. The lower unit is a brown silt in Monmouth County (Jablonski, 1968).

As presented in the *Site Investigation Report - Main Post and Charles Wood Areas, Fort Monmouth, New Jersey*, prepared by Weston, Inc, December 1995 (Weston SI), several natural and anthropogenic factors contribute to the wide range in concentrations of metals in soils, which further impact the concentration of metals in groundwater. Soils derived from the glauconitic sands contain abundant aluminum, calcium, potassium, iron, magnesium and manganese (among others), which are likely to be present at elevated concentrations in the groundwater, particularly when sediments are entrained in the collected groundwater samples.

As presented in the Weston SI Report (relevant portions presented in **Appendix C**), the lithologic logs from monitoring well installations indicate that the lithology at the M-5 Landfill Site consists of a thin soil cover (0.5 feet) underlain by fill material. The components of the fill materials observed in the borings consist of coal, glass and plastic fragments intermixed with a silty sand and clay matrix. Groundwater saturation was observed at approximately 4 feet below ground surface (bgs) across the site. Water-level elevation data collected during the Weston SI indicates that local groundwater flow is consistently to the west toward Mill Creek.

2.3.2 Hydrogeology

Fort Monmouth lies in the Atlantic and Eastern Gulf Coastal Plain groundwater region (Meisler et al., 1988). This groundwater region is underlain by undeformed, unconsolidated to semi-consolidated sedimentary deposits. The chemistry of the water near the surface is variable with low dissolved solids and high iron concentrations. The water chemistry in areas underlain by glauconitic sediments (such as Red Bank, Tinton and Hornerstown Sands) is dominated by calcium, magnesium, manganese, aluminum and iron. The sediments in the area of Fort Monmouth were deposited in fluvial-deltaic to near shore environments.

The water table aquifer in the Main Post Area is identified as part of the "Navesink-Hornerstown Confining Units," or minor aquifers. The minor aquifers include the Navesink formation, Red Bank Sand, Tinton Sand, Hornerstown Sand, Vincentown Formation, Manasquan Formation, Shark River Formation, Piney Point Formation and the basal clay of the Kirkwood Formation. These geologic formations comprise a "Composite Confining Bed" for the Wenonah Mount Laurel Aquifer (Zapecza, 1984).

Wells installed in the Red Bank and Tinton Sands produce 2 to 25 gallons per minute (gpm) (Jablonski, 1968). Groundwater is typically encountered at the Main Post and in the surrounding areas at shallow depths below ground surface (2 to 9 feet bgs). Water in the surficial aquifer generally flows east toward the Atlantic Ocean.

Based on a review of the NJDEP GWQS (NJAC 7:9-6), January 7, 1993, Versar has determined that the site is underlain by a Class III-A aquifer. A formal presentation of this finding was made to the NJDEP on April 17, 2001. The primary designated use for Class III-A groundwater is the release or transmittal of groundwater to adjacent classification areas and surface water, as relevant. Secondary designated uses in Class III-A include any reasonable use.

Shallow groundwater may be locally influenced within the Main Post Area by the following factors:

- Tidal influence (based on proximity to the Atlantic Ocean, rivers, and tributaries)
- Topography
- Nature of the fill material within the Main Post area
- Presence of clay and silt lenses in the natural overburden deposits
- Local groundwater recharge areas (i.e., streams, lakes)
- Roadways, utility conduits, and stormwater culverts

Due to the fluvial nature of the overburden deposits (e.g., sand and clay lenses), shallow groundwater flow direction is best determined on a case-by-case basis.

2.3.3 Soils

According to the U.S. Department of Agriculture (USDA), Soil Conservation Service, Monmouth County Soil Survey, the majority of the Main Post is covered by urban land (**Figure 2-3**). The soil survey described urban land as areas where concrete, asphalt, buildings, shopping centers, airports or other impervious surfaces cover 80 percent or more of the surface. In addition, the survey indicated that the natural subsurface soils have largely been replaced with artificial or foreign fill materials (developed land with disturbed soils). The following soil series and classification units are mapped in the Main Post Area:

- DoB Downer sandy loam (with 2 to 5 percent slopes);
- FrB Freehold sandy loam (with 2 to 5 percent slopes);
- FUB Freehold sandy loam/urban land complex (with 0 to 10 percent slopes);
- HV Humaquepts, frequently flooded;
- KvA Kresson loam (with 0 to 5 percent slopes);
- UA Udorthents, smoothed; and
- UD Udorthents – urban land complex (with 0 to 3 percent slopes).

The Downer series soils are well-drained soils that are found on uplands and terraces. The soils are formed in acid, silty coastal plain sediments. The Freehold soils are also well drained and are formed in acid, loamy, coastal plain sediments that, by volume, are one to 10 percent glauconite and are found on uplands. The Humaquepts soils are somewhat poorly- to very poorly-drained soils that are formed in stratified, sandy, or loamy sediments of fluvial origins. The Humaquepts soils are located on the floodplain and are subject to flooding several times each year. The Kresson loam is a nearly level to gently sloping soil and is somewhat poorly drained. The soil is found on low divides and in depressions. The Udorthents soils have been altered by excavation or filling activities. In filled areas, these soils consist of loamy material that is more than 20 inches thick. The filled areas include floodplain, tidal marshes and areas with moderately well drained to very poorly drained soils. Some Udorthent soils contain concrete, asphalt, metal and glass. The soils in the vicinity of the M-12 Landfill Site are classified as UA – Udorthents, smoothed, which may also include old sand and gravel pits that have been smoothed or filled in (Weston, 1995).

2.3.4 Topography and Surface Drainage

Over the last 80 years, the natural topography of Fort Monmouth has been altered by excavation and filling activities conducted by the military. The land surface at the Main Post is relatively flat and ranges in elevation from approximately 4 feet above mean sea level (amsl) in the east at Oceanport Creek to 32 feet amsl at the western end of the post, near Highway 35. The eastern half of the post is generally 10 feet amsl in elevation.

Surface water runoff from the western part of the Main Post flows into the Lafetra Creek to the north or into Mill Creek to the south. The USGS topographic map (**Figure 2-1**) shows the Lafetra Creek as Parkers Creek Branch and Mill Creek as Wampum. Both Mill Creek and Lafetra Creek originate off-post. Mill Creek flows along the southern boundary of the Main Post, turning north just past the Auto Craft Shop. Lafetra Creek forms the northern boundary of the Main Post and joins Mill Creek to form Parkers Creek. Husky Brook flows eastward in the southern part of the Main Post from Husky Brook Lake and into Oceanport Creek. Parkers Creek flows eastward along the northern boundary and joins Oceanport Creek east of the post. Most of Husky Brook, Parkers Creek, Lafetra Creek and Mill Creek are tidally influenced.

The U.S. Fish and Wildlife Service (FWS) National Wetland Inventory Long Branch quadrangle maps indicate the presence of wetlands at the Main Post. Parkers Creek and Oceanport Creek are classified as estuarine intertidal aquatic beds. The area of Parkers Creek and the part of Oceanport Creek/Husky Brook are classified as estuarine intertidal emergent wetlands. Lafetra Creek and Mill Creek are classified as riverine lower perennial open water/unknown bottom.

The M-5 Landfill Site is located on the east side of Mill Creek, which flows eastward into Parkers Creek. The USGS topographic map (**Figure 2-1**) shows that the land surface of the site is relatively flat at an elevation of less than 20 feet amsl. Surface water runoff from the M-5 Landfill Site is likely to flow west into Mill Creek.

3.0 SITE ACTIVITIES

The DPW conducted this remedial investigation in accordance that the NJDEP Technical Requirements for Site Remediation (N.J.A.C. 26:E) to characterize near surface soils and assess potential risks to human health or the environment. The remedial investigation activities consisted of the collection of near-surface soil samples at the M-5 Landfill Site. Remedial investigation activities were performed between April 1998 and August 1998. These activities were managed by the Fort Monmouth DPW and performed by TECOM-Vinnell Services (TVS). The details of remedial investigation activities that occurred at the M-5 Landfill Site are described below.

The DPW characterized the near-surface soils at the M-5 Landfill Site by completing 254 borings (B01-B254) at the site. Samples were collected using a 2-inch Geoprobe® Macrocore sampler. Sampling activities were performed in accordance with the *Fort Monmouth Standard Sampling Operating Procedure* (December 1997). A total of 508 soil samples were collected from the 254 borings and were analyzed for the presence of VOCs, SVOCs, pesticides, PCBs and TAL metals. The soil boring locations were located in and around the M-5 Landfill Site as identified in the Weston SI (1995). The locations of the borings were established in a grid-like pattern within the previously designated boundaries of the M-5 Landfill Site.

Each of the soil samples, except those prepared for VOC analysis, were collected between approximately 0 and 12 inches bgs. VOC samples were taken at approximately 24 inches bgs since surface soils would not be expected to retain volatile constituents over time.

Laboratory analyses of the samples collected at the M-5 Landfill Site were conducted at the Fort Monmouth Environmental Testing Laboratory (FMETL), a New Jersey certified laboratory (Certification No. 13461). The locations of these 254 borings are shown in **Figure 3-1**. A summary of the soil sample collection information and analyses performed is provided in **Table 3-1**. Soil sample laboratory data sheets are provided in **Appendix D**. Soil boring logs are presented in **Appendix E**. Soil analytical results are discussed in **Section 4.0**.

4.0 SOIL SAMPLING RESULTS AND COMPLIANCE ANALYSIS

A summary of the laboratory analytical results for near-surface soils at the M-5 Landfill Site is discussed below. The results were compared with the Cleanup Standards for Contaminated Sites (N.J.A.C. 7:26D), which was revised with Soil Cleanup Criteria dated May 12, 1999. The soil analytical results are presented by analyte (VOCs, SVOCs, Pesticides and PCBs and TAL Metals) and compare the analytical data with the NJDEP RDCSCC. Exceedences of the RDCSCC were subjected to further evaluation involving compliance averaging and site-specific considerations. All of the soil sample results in this report are expressed in milligrams per kilogram (mg/kg), equivalent to parts per million (ppm).

4.1 Soil Analytical Results

The analytical results from the 508 soil samples collected from 254 borings at the M-5 Landfill Site are discussed below, and are included in **Table 4-1**. The soil analytical data is provided in **Appendix D**. The data presented in **Table 4-1** are compared to the RDCSCC. Soil samples from the 254 borings at the M-5 Landfill Site were analyzed for VOCs, SVOCs, pesticides and PCBs and metals. The results that exceeded the respective RDCSCC are shaded in **Table 4-1**.

4.1.1 VOCs

VOC analyses were conducted on soil samples collected from the 254 soil borings at the M-5 Landfill Site (see **Figure 4-1**). Each of these soil samples was collected at approximately the same depth range, 24 inches bgs.

Soil cleanup criteria for VOCs were exceeded in two of the 254 soil boring locations. The borings that presented exceedences of VOCs are listed in **Table 4-2**. One VOC was detected in site soils at concentrations above the RDCSCC. The one VOCs that exceeded the RDCSCC is, with number of exceedences in parentheses, Tetrachloroethene (2). **Table 4-3** presents a summary of the results, identifying the maximum, minimum and average exceedences for this parameter. A discussion of these exceedences is presented below.

- Tetrachloroethene was detected in two of the site soil samples above the RDCSCC of 4.0 mg/kg. The exceedence concentrations ranged from a minimum of 4.8 mg/kg (B23) to a maximum of 5.0 mg/kg (B15). The average exceedence concentration for Tetrachloroethene is 4.90 mg/kg.

4.1.2 SVOCs

SVOC analyses were conducted on soil samples collected from the 254 soil borings at the M-5 Landfill Site (see **Figure 4-2**). Each of these soil samples was collected at approximately the same depth range, 6-12 inches bgs.

Soil cleanup criteria for SVOCs were exceeded in 17 of the 254 soil boring locations. The borings that presented exceedences of SVOCs are listed in **Table 4-2**. Seven SVOCs were detected in site soils at concentrations above the RDCSCC. The seven SVOCs that exceeded the RDCSCC are, with number of exceedences in parentheses, Benzo(a)anthracene (11), Benzo(a)pyrene (17), Benzo(b)fluoranthene (10), Benzo(k)fluoranthene (10), Chrysene (3), Dibenz(a,h)anthracene (4), and Indeno(1,2,3-cd)pyrene (7). **Table 4-3** presents a summary of the results, identifying the maximum, minimum and average exceedences for each of these parameters. A discussion of these exceedences is presented below.

- Benzo(a)anthracene was detected in 11 of the site soil samples above the RDCSCC of 0.9 mg/kg. The exceedence concentrations ranged from a minimum of 0.97 mg/kg (B72) to a maximum of 14 mg/kg (B220). The average exceedence concentration for Benzo(a)anthracene is 4.369 mg/kg.

- Benzo(a)pyrene was detected in 17 site soil samples above the RDCSCC of 0.66 mg/kg. The exceedence concentrations ranged from a minimum of 0.67 mg/kg (B26, B42) to a maximum of 11 mg/kg (B84). The average exceedence concentration for Benzo(a)pyrene is 2.405 mg/kg.

- Benzo(b)fluoranthene was detected in ten of the site soil samples above the RDCSCC of 0.9 mg/kg. The exceedence concentrations ranged from a minimum of 1.1 mg/kg (B218) to a maximum of 9.5 mg/kg (B220). The average exceedence concentration for Benzo(b)fluoranthene exceedences is 3.69 mg/kg.

- Benzo(k)fluoranthene was detected in ten of the site soil samples above the RDCSCC of 0.9 mg/kg. The exceedence concentrations ranged from a minimum of 1.2 mg/kg (B218, B72) to a maximum of 8.8 mg/kg (B84). The average exceedence concentration for Benzo(k)fluoranthene is 2.60 mg/kg.

- Chrysene was detected in three site soil samples above the RDCSCC of 9.0 mg/kg. The exceedence concentrations ranged from a minimum of 9.7 mg/kg (B92) to a maximum of 25 mg/kg (B220). The average exceedence concentration for Chrysene is 18.567 mg/kg.

- Dibenz(a,h)anthracene was detected in four site soil samples above the RDCSCC of 0.66 mg/kg. The exceedence concentrations ranged from a minimum of 1.0 mg/kg (B71) to a maximum of 2.9 mg/kg (B84). The average exceedence concentration for Chrysene is 1.70 mg/kg.

- Indeno(1,2,3-cd)pyrene was detected in seven of the site soil samples above the RDCSCC of 0.9 mg/kg. The exceedence concentrations ranged from a minimum of 1.2 mg/kg (B27) to a maximum of 4.9 mg/kg (B84). The average exceedence concentration for Indeno(1,2,3-cd)pyrene is 2.343 mg/kg.

4.1.3 Pesticides and PCBs

Pesticide and PCB analyses were conducted on soil samples collected from the 254 borings at the M-5 Landfill Site (see **Figure 4-3**). Each of these soil samples was collected at approximately the same depth range, 6-12 inches bgs. Each of the 254 borings was analyzed for 19 pesticides and seven PCB compounds.

Soil cleanup criteria for pesticides were exceeded in nine of the 254 soil boring locations. The borings that presented exceedences of pesticides are listed in **Table 4-2**. Four pesticides were detected in site soils at concentrations above the RDCSCC. The four pesticides that exceeded the RDCSCC are, with number of exceedences in parentheses, 4,4'-DDD (1), 4,4'-DDE (3), 4,4'-DDT (9), and Dieldrin (1). **Table 4-3** presents a summary of the results, identifying the maximum, minimum and average exceedences for each of these parameters. A discussion of these exceedences is presented below.

- 4,4'-DDD was detected in one site soil sample above the RDCSCC of 3.0 mg/kg at a concentration of 3.787 mg/kg (B254).

- 4,4'-DDE was detected in three of the site soil samples above the RDCSCC of 2.0 mg/kg. The exceedence concentrations ranged from a minimum of 2.058 mg/kg (B59) to a maximum of 4.185 mg/kg (B254). The average exceedence concentration for 4,4'-DDE is 3.191 mg/kg.

- 4,4'-DDT was detected in nine of the site soil samples above the RDCSCC of 2.0 mg/kg. The exceedence concentrations ranged from a minimum of 2.094 mg/kg (B251) to a maximum of 56.446 mg/kg (B254). The average exceedence concentration for 4,4'-DDT is 13.425 mg/kg.

- Dieldrin was detected in one site soil sample above the RDCSCC of 0.042 mg/kg at a concentration of 0.049 mg/kg (B239).

Soil cleanup criteria for PCBs were exceeded in one of the 254 soil boring locations. The boring that presented exceedences of PCBs are listed in **Table 4-2**. One PCB was detected in site soils at concentrations above the RDCSCC. The one PCB that exceeded the RDCSCC is, with number of exceedences in parentheses, Arochlor 1254 (1). **Table 4-3** presents a summary of the results, identifying the maximum, minimum and average exceedences for this parameter. A discussion of these exceedences is presented below.

- Arochlor 1254 was detected in one site soil sample above the RDCSCC of 0.49 mg/kg at a concentration of 1.499 mg/kg (B201).

4.1.4 Metals

The soil samples from the 254 borings (see **Figure 4-3**) were analyzed for 24 TAL metals. The samples were collected from depths of 6-12 inches. A total of seven metals were detected at concentrations above their respective RDCSCC at 28 of 254 boring locations. The borings that contained exceedences of metals are listed in **Table 4-2**. The seven metals that exceeded the RDCSCC in the borings are, with the number of exceedences in parentheses, Arsenic (9), Beryllium (3), Copper (4) Lead (15), Mercury (1), Nickel (1), Thallium (1) and Zinc (3). **Table 4-3** presents a summary of the results, presenting the maximum, minimum and average exceedences for each of these parameters. A discussion of these exceedences is presented below.

- Arsenic was detected in nine of the site soil samples above the RDCSCC of 20 mg/kg. The exceedence concentrations ranged from a minimum of 20.13 mg/kg (B02) to a maximum of 1,030 mg/kg (B19). The average exceedence concentration for Arsenic is 164.416 mg/kg.

- Beryllium was detected in three of the site soil samples above the RDCSCC of 2.0 mg/kg. The exceedence concentrations ranged from a minimum of 2.05 mg/kg (B254) to a maximum of 10.89 mg/kg (B35). The average exceedence concentration for Beryllium is 5.909 mg/kg.

- Copper was detected in four of the site soil samples above the RDCSCC of 600 mg/kg. The exceedence concentrations ranged from a minimum of 1,168 mg/kg (B99) to a maximum of 2,837 mg/kg (B09). The average exceedence concentration for Copper is 1,965.75 mg/kg.

- Lead was detected in 15 of the site soil samples above the RDCSCC of 400 mg/kg. The exceedence concentrations ranged from a minimum of 494 mg/kg (B199) to a maximum of 4,549 mg/kg (B99). The average exceedence concentration for Lead is 1,357.733 mg/kg.

- Mercury was detected above the RDCSCC of 14 mg/kg in one site soil sample at a concentration of 17.584 mg/kg (B59).

- Nickel was detected above the RDCSCC of 250 mg/kg in one site soil sample at a concentration of 431 mg/kg (B242).

- Thallium was detected above the RDCSCC of 2.0 mg/kg in one site soil sample at a concentration of 47.42 mg/kg (B35).

- Zinc was detected in three of the site soil samples above the RDCSCC of 1,500 mg/kg. The exceedence concentrations ranged from a minimum of 1,598 mg/kg (B44) to a maximum of 9,772 mg/kg (B99). The average exceedence concentration for Zinc is 4,393.0 mg/kg.

4.2 Compliance Analysis Method

The first step in determining compliance with the NJDEP Technical Requirements for Site Remediation (7:26E) at the M-5 Landfill Site was to complete the soil sampling analysis. The analytical results from the 508 soil samples collected from 254 borings at the M-5 Landfill Site are discussed above and are included in **Table 4-1**. The method used to determine regulatory compliance is portrayed as a decision tree in **Figure 4-5** and described below.

Figures 4-1, **4-2**, **4-3** and **4-4** present the analytical results for VOCs, SVOCs, pesticides and PCBs and metals, respectively, by soil boring, for those analytes that exceeded the RDCSCC at one or more locations. The results for each analyte presented are uniquely colored at each boring location, and results that exceed the respective RDCSCC have been "boxed" in "red." These results are discussed in greater detail in **Section 4.2**. The borings that contained exceedences of the RDCSCC are shown in **Table 4-2**.

For many of the analytical results that exceeded the RDCSCC, the "compliance averaging" approach was then used to determine compliance with NJDEP technical requirements. Compliance averaging uses the average contaminant concentration in an area of concern rather than the contaminant concentration of individual samples for comparison to applicable soil cleanup criteria. The NJDEP policy for compliance averaging is presented in an article entitled, *Compliance Averaging*, from the NJDEP Spring 1995 (Volume 7, No. 2 – Article 08) issue of *Site Remediation News*.

There are several analyte-specific conditions that determine whether compliance averaging can be applied to an exceedence of NJDEP soil cleanup criteria, including maximum analytical results ("ceilings") for individual samples based on the particular NJDEP criterion, as well as specific requirements for arsenic, thallium, beryllium, Benzo(a)pyrene and Dibenz(a,h)anthracene. The compliance analysis method used for the M-5 Landfill Site for each detected analyte that exceeded the respective RDCSCC is summarized in the last column in **Table 4-4**.

Compliance averaging was performed for analytes that met the requirements as summarized in **Figure 4-5**. Compliance average areas were identified within the M-5 Landfill Site based on analyte category (such as VOCs, SVOCs, etc.). The boundaries for these areas of concern were based on areas within that M-5 Landfill Site that presented exceedences of the RDCSCC. Soil borings outside of the areas of concern (referred to as "clean areas" in NJDEP, 1995) presented contaminant concentrations below the RDCSCC and were not included in calculating compliance averages. The boundaries of the compliance average areas are shown in **Figures 4-1** (VOCs), **4-2**

(SVOCs), **4-3** (pesticides and PCBs) and **4-4** (metals). The compliance average area names are shown in **Appendix F**. The compliance average area names are defined according to the analyte category, such as "AREA VOC-1." When calculating average results, the following rules applied:

1) One-half the MDL was used for non-detect (ND) results.
2) If a sample was diluted, ND results were not used in computing the average.
3) For estimated results (results with "J" qualifiers), the estimated result was used for computing the averages.
4) Compliance averages were calculated as the mean of the results incorporating the ND and estimated results described above.

The compliance averages areas are presented in **Appendix F** and summarized in **Table 4-5**. Compliance averages that were below the NJDEP criteria for a particular analyte justify a recommendation for No Further Action. No Further Action was also justified if a compliance average meets the following conditions for *de minimus* exceedence:

1) Compliance averages met the same analyte-specific conditions that are used for determining whether compliance averaging can be applied,
2) Contaminant concentrations were found within a limited area (for the M-5 Landfill Site, a 15-foot radius, or one-half the grid-spacing, was used for the *de minimus* area determination),
3) Evaluation of contaminant mass, persistence, and location indicated limited potential for significant human health or environmental impacts, and
4) There can only be one *de minimus* exemption per area of concern.

Finally, if an analyte did not meet the *de minimus* conditions, or did not meet the analyte-specific conditions required to perform compliance averaging, additional site-specific parameters were considered as conditions for a No Further Action proposal. If further analysis of the analytical results did not define a "source area" or level of contamination that necessitated the identification and evaluation of potential remedial actions, then the exceedence was considered marginal, or an isolated location and no further action is warranted for the near surface soils. However, to further address the exceedences in the near surface soils, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan for soils at the M-5 Landfill Site presenting the exceedence.

4.3 Compliance Analysis

The Compliance analysis method used to evaluate exceedences of the RDCSCC is presented in **Table 4-4,** and the discussion below is presented for VOCs, SVOCs, pesticides and PCBs and metals and compares the analytical data with the RDCSCC. **Table 4-5** summarizes the compliance averaging results. A summary of the compliance analysis for analytes that exceeded the RDCSCC is provided in **Table 4-6**.

4.3.1 VOCs

One VOC was detected in site soils at concentrations above its respective RDCSCC: Tetrachloroethene. For the purposes of compliance analysis, the sample locations with exceedences of the RDCSCC for VOCs have been grouped into one area, AREA VOC-1. The borings contained within this compliance average area are labeled in **Figure 4-1** and listed in **Appendix F**. The compliance analysis method for these compounds is presented in **Table 4-4**.

Tetrachloroethene (AREA VOC-1)

Tetrachloroethene was detected in two of the site soil samples above the RDCSCC of 4.0 mg/kg at concentrations ranging from 4.8 mg/kg to 5.0 mg/kg (average exceedence concentration of 4.90 mg/kg).

Compliance averaging conducted for Tetrachloroethene in AREA VOC-1 yielded the compliance average concentration of 3.247 mg/kg. Therefore, the compliance average for Tetrachloroethene in AREA VOC-1 is below the RDCSCC of 4.0 mg/kg and is not of concern.

These findings support a No Further Action determination for Tetrachloroethene in near-surface soils at the M-5 Landfill Site.

4.3.2 SVOCs

Seven SVOCs were detected in site soils at concentrations above their respective RDCSCC: Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Chrysene, Dibenz(a,h)anthracene and Indeno(1,2,3-cd)pyrene. For the purposes of compliance analysis, the sample locations with exceedences of the RDCSCC for SVOCs have been grouped into one area, AREA SVOC-1. The borings contained within this compliance average area are labeled in **Figure 4-2** and listed in **Appendix F**. The compliance analysis method for these compounds is presented in **Table 4-4**.

Benzo(a)anthracene (AREA SVOC-1)

Benzo(a)anthracene was detected in 11 of the site soil samples above the RDCSCC of 0.9 mg/kg at concentrations ranging from 0.97 mg/kg to 14 mg/kg (average exceedence concentration of 4.369 mg/kg). Because the maximum concentration of Benzo(a)anthracene was greater than the 10X ceiling limit of 9 mg/kg in AREA SVOC-1, compliance averaging was not appropriate for Benzo(a)anthracene for this area of the M-5 Landfill Site.

Due to the limited presence of Benzo(a)anthracene in the area of the M-5 Landfill Site identified as AREA SVOC-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent

to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Benzo(a)anthracene at the M-5 Landfill Site (AREA SVOC-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Benzo(a)anthracene in near-surface soils at the M-5 Landfill Site.

Benzo(a)pyrene (AREA SVOC-1)

Benzo(a)pyrene was detected in 17 site soil samples above the RDCSCC of 0.66 mg/kg at concentrations ranging from 0.67 mg/kg to 11 mg/kg (average exceedence concentration of 2.405 mg/kg). Compliance averaging was not undertaken for Benzo(a)pyrene because, as described in the Spring 1995 *Site Remediation News* (Volume 7, Number 2), NJDEP's guidance regarding the use of multiplication factors (initially applied to RDCSCCs to limit the maximum allowable concentration for individual samples) had changed. NJDEP's current guidance is to apply the multiplication factors to health based criteria, not RDCSCC. The health-based criteria for Benzo(a)pyrene in soil is 0.09 mg/kg. Applying the 10X factor to 0.09 mg/kg means that no individual sample may exceed 0.9 mg/kg for the purposes of compliance averaging. Therefore, compliance averaging was not appropriate for the M-5 Landfill Site with respect to Benzo(a)pyrene.

Due to the limited presence of Benzo(a)pyrene in the area of the M-5 Landfill Site identified as AREA SVOC-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Benzo(a)pyrene at the M-5 Landfill Site (AREA SVOC-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Benzo(a)pyrene in near-surface soils at the M-5 Landfill Site.

Benzo(b)fluoranthene (AREA SVOC-1)

Benzo(b)fluoranthene was detected in ten of the site soil samples above the RDCSCC of 0.9 mg/kg at concentrations ranging from 1.1 mg/kg to 9.5 mg/kg (average exceedence concentration of 3.69 mg/kg).

Compliance averaging was conducted for Benzo(b)fluoranthene in AREA SVOC-1 and found to be 0.885 mg/kg. Therefore, the compliance average for Benzo(b)fluoranthene in AREA SVOC-1 is below the RDCSCC of 0.9 mg/kg and is not of concern.

These findings support a No Further Action determination for Benzo(b)fluoranthene in near-surface soils at the M-5 Landfill Site.

Benzo(k)fluoranthene (AREA SVOC-1)

Benzo(k)fluoranthene was detected in ten of the site soil samples above the RDCSCC of 0.9 mg/kg at concentrations ranging from 1.2 mg/kg to 8.8 mg/kg (average exceedence concentration of 2.60 mg/kg).

Compliance averaging was conducted for Benzo(k)fluoranthene in AREA SVOC-1 and found to be 0.664 mg/kg. Therefore, the compliance average for Benzo(b)fluoranthene in AREA SVOC-1 is below the RDCSCC of 0.9 mg/kg and is not of concern.

These findings support a No Further Action determination for Benzo(k)fluoranthene in near-surface soils at the M-5 Landfill Site.

Chrysene (AREA SVOC-1)

Chrysene was detected in three site soil samples above the RDCSCC of 9.0 mg/kg at concentrations ranging from 9.7 mg/kg to 25 mg/kg (average exceedence concentration of 18.567 mg/kg).

Compliance averaging was conducted for Chrysene in AREA SVOC-1 and found to be 1.812 mg/kg. Therefore, the compliance average for Chrysene in AREA SVOC-1 is below the RDCSCC of 9.0 mg/kg and is not of concern.

These findings support a No Further Action determination for Chrysene in near-surface soils at the M-5 Landfill Site.

Dibenz(a,h)anthracene (AREA SVOC-1)

Dibenz(a,h)anthracene was detected in four site soil samples above the RDCSCC of 0.66 mg/kg at concentrations ranging from 1.0 mg/kg to 2.9 mg/kg (average exceedence concentration of 1.70 mg/kg). Compliance averaging was not undertaken for Dibenz(a,h)anthracene because, as described in the Spring 1995 *Site Remediation News* (Volume 7, Number 2), NJDEP's guidance regarding the use of multiplication factors (initially applied to RDCSCCs to limit the maximum allowable concentration for individual samples) had changed. NJDEP's current guidance is to apply the multiplication factors to health based criteria, not RDCSCC. The health-based criteria for Dibenz(a,h)anthracene in soil is 0.09 mg/kg. Applying the 10X factor to 0.09 mg/kg means that no individual sample may exceed 0.9 mg/kg for the purposes of compliance averaging. Therefore, compliance averaging was not appropriate for AREA SVOC-1 at the M-5 Landfill Site with respect to Dibenz(a,h)anthracene.

Due to the limited presence of Dibenz(a,h)anthracene in the area of the M-5 Landfill Site identified as AREA SVOC-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Dibenz(a,h)anthracene at the M-5 Landfill Site (AREA

SVOC-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Dibenz(a,h)anthracene in near-surface soils at the M-5 Landfill Site.

Indeno(1,2,3-cd)pyrene (AREA SVOC-1)

Indeno(1,2,3-cd)pyrene was detected in seven of the site soil samples above the RDCSCC of 0.9 mg/kg at concentrations ranging from 1.2 mg/kg to 4.9 mg/kg (average exceedence concentration of 2.343 mg/kg).

Compliance averaging conducted for Indeno(1,2,3-cd)pyrene in AREA SVOC-1 yielded the compliance average concentration of 0.517 mg/kg. Therefore, the compliance average for Indeno(1,2,3-cd)pyrene in AREA SVOC-1 does not exceed the RDCSCC of 0.9 mg/kg and is not of concern.

These findings support a No Further Action determination for Indeno(1,2,3-cd)pyrene in near-surface soils at the M-5 Landfill Site.

4.3.3 Pesticides and PCBs

Four pesticides were detected in site soils at concentrations above their respective RDCSCC: 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, and Dieldrin. For the purposes of compliance analysis, the sample locations with exceedences of the RDCSCC for pesticides have been grouped into one area, AREA PESTPCB-1. The borings contained within this compliance average area are labeled in **Figure 4-3** and listed in **Appendix F**. The compliance analysis method for these compounds is presented in **Table 4-4**.

4,4'-DDD (AREA PESTPCB-1)

4,4'-DDD was detected in one site soil sample above the RDCSCC of 3.0 mg/kg at a concentration of 3.787 mg/kg.

Compliance averaging for 4,4'-DDD in AREA PESTPCB-1 yielded the compliance average concentration of 0.479 mg/kg. Therefore, the compliance average for 4,4'-DDD in AREA PESTPCB-1 is below the RDCSCC of 3.0 mg/kg and is not of concern. These findings support a No Further Action determination for 4,4'-DDD in near-surface soils at the M-5 Landfill Site.

4,4'-DDE (AREA PESTPCB-1)

4,4'-DDE was detected in three of the site soil samples above the RDCSCC of 2.0 mg/kg at concentrations ranging from 2.058 mg/kg to 4.185 mg/kg (average exceedence concentration of 3.191 mg/kg).

Compliance averaging for 4,4'-DDE in AREA PESTPCB-1 yielded the compliance average concentration of 0.654 mg/kg. Therefore, the compliance average for 4,4'-DDE in AREA PESTPCB-1 is below the RDCSCC of 2.0 mg/kg and is not of concern.

These findings support a No Further Action determination for 4,4'-DDE in near-surface soils at the M-5 Landfill Site.

4,4'-DDT (AREA PESTPCB-1)

4,4'-DDT was detected in nine of the site soil samples above the RDCSCC of 2.0 mg/kg at concentrations ranging from 2.094 mg/kg to 56.446 mg/kg (average exceedence concentration of 13.425 mg/kg). Because the maximum concentration of 4,4'-DDT was greater than the 10X ceiling limit of 20 mg/kg in AREA PESTPCB-1, compliance averaging was not appropriate for 4,4'-DDT for this area of the M-5 Landfill Site.

Due to the limited presence of 4,4'-DDT in the area of the M-5 Landfill Site identified as AREA PESTPCB-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of 4,4'-DDT at the M-5 Landfill Site (AREA PESTPCB-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for 4,4'-DDT in near-surface soils at the M-5 Landfill Site.

Dieldrin (AREA PESTPCB-1)

Dieldrin was detected in one site soil sample above the RDCSCC of 0.042 mg/kg at a concentration of 0.049 mg/kg.

Compliance averaging for Dieldrin in AREA PESTPCB-1 yielded the compliance average concentration of 0.049 mg/kg. Therefore, the compliance average for Dieldrin in AREA PESTPCB-1 is marginally above the RDCSCC of 0.042 mg/kg and is not of concern.

These findings support a No Further Action determination for Dieldrin in near-surface soils at the M-5 Landfill Site.

One PCB was detected in site soils at concentrations above its RDCSCC: Arochlor 1254. For the purposes of compliance analysis, the sample locations with exceedences of the RDCSCC for PCBs have been grouped into one area, AREA PESTPCB-1. The boring contained within this compliance average area is labeled in **Figure 4-3** and listed in **Appendix F**. The compliance analysis method for this compound is presented in **Table 4-4**.

Arochlor 1254 (AREA PESTPCB-1)

Arochlor 1254 was detected in one site soil sample above the RDCSCC of 0.49 mg/kg at a concentration of 1.499 mg/kg.

Compliance averaging for Arochlor 1254 in AREA PESTPCB-1 yielded the compliance average concentration of 0.832 mg/kg. Therefore, the compliance average for Arochlor 1254 in AREA PESTPCB-1 is marginally above the RDCSCC of 0.49 mg/kg and is not of concern.

These findings support a No Further Action determination for Arochlor 1254 in near-surface soils at the M-5 Landfill Site.

4.3.4 Metals

Seven metals were detected at concentrations above their respective RDCSCC: Arsenic, Beryllium, Copper, Lead, Mercury, Thallium and Zinc. For the purpose of compliance analysis, the sample locations with exceedences of the RDCSCC for metals have been grouped into one area, AREA METALS-1. The borings contained within these compliance average areas are labeled in **Figure 4-4** and listed in **Appendix F**. The compliance analysis method for these compounds is presented in **Table 4-4**.

Arsenic (AREA METALS-1)

Arsenic was detected in nine of the site soil samples above the RDCSCC of 20 mg/kg at concentrations ranging from 20.13 mg/kg to 1,030 mg/kg (average exceedence concentration of 164.416 mg/kg). Compliance averaging was not undertaken for Arsenic because, as described in the Spring 1995 *Site Remediation News* (Volume 7, Number 2), the 20 mg/kg RDCSCC for arsenic is already 50 times higher than the health based number for arsenic (0.4 mg/kg). Many of these samples also exceeded the site-specific maximum background concentration for Arsenic in soils (Weston, 1995) of 22.9 mg/kg.

Due to the distribution of Arsenic in the area of the M-5 Landfill Site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Arsenic at the M-5 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Arsenic in near-surface soils at the M-5 Landfill Site.

Beryllium (AREA METALS-1)

Beryllium was detected above the RDCSCC of 2.0 mg/kg in three site soil samples at concentrations ranging from 2.05 mg/kg to 10.89 mg/kg (average exceedence concentration of 5.909 mg/kg). Compliance averaging was not undertaken for Beryllium because, as described in the Spring 1995 *Site Remediation News* (Volume 7, Number 2),

compliance averaging is not appropriate for soil samples that present Beryllium concentrations that exceed 2.0 mg/kg.

Due to the limited presence of Beryllium in the area of the M-5 Landfill Site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Beryllium at the M-5 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Beryllium in near-surface soils at the M-5 Landfill Site.

Copper (AREA METALS-1)

Copper was detected above the RDCSCC of 600 mg/kg in four site soil samples at concentrations ranging from 1,168 mg/kg to 2,837 mg/kg (average exceedence concentration of 1,965.75 mg/kg). Because the maximum concentration of Copper was greater than the 2X ceiling limit of 1,200 mg/kg in AREA METALS-1, compliance averaging was not appropriate for Copper for this area of the M-5 Landfill Site.

Due to the limited presence of Copper in the area of the M-5 Landfill Site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Copper at the M-5 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Copper in near-surface soils at the M-5 Landfill Site.

Lead (AREA METALS-1)

Lead was detected above the RDCSCC of 400 mg/kg in 15 site soil samples at concentrations ranging from 494 mg/kg to 4,549 mg/kg (average exceedence concentration of 1,357.733 mg/kg). Because the maximum concentration of Lead was greater than the 2X ceiling limit of 800 mg/kg in AREA METALS-1, compliance averaging was not appropriate for Lead for this area of the M-5 Landfill Site.

Due to the limited presence of Lead in the area of the M-5 Landfill Site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Lead at the M-5 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Lead in near-surface soils at the M-5 Landfill Site.

Mercury (AREA METALS-1)

Mercury was detected above the RDCSCC of 14 mg/kg at one boring at a concentration of 17.584 mg/kg.

Compliance averaging conducted for Mercury in AREA METALS-1 yielded the compliance average concentration of 1.089 mg/kg. Therefore, the compliance average for Mercury in AREA METALS-1 is below the RDCSCC of 14 mg/kg and is not of concern.

These findings support a No Further Action determination relative to Mercury in near-surface soils at the M-5 Landfill Site.

Nickel (AREA METALS-1)

Nickel was detected above the RDCSCC of 250 mg/kg at one boring at a concentration of 431 mg/kg.

Compliance averaging conducted for Nickel in AREA METALS-2 yielded the compliance average concentration of 66.644 mg/kg. Therefore, the compliance average for Nickel in AREA METALS-2 is below the RDCSCC of 250 mg/kg and is not of concern.

These findings support a No Further Action determination relative to Nickel in near-surface soils at the M-5 Landfill Site.

Thallium (AREA METALS-1)

Thallium was detected above the RDCSCC of 2.0 mg/kg in one site soil sample at a concentration of 47.42 mg/kg. Compliance averaging was not undertaken for Thallium because, as described in the Spring 1995 *Site Remediation News* (Volume 7, Number 2), the 2.0 mg/kg RDCSCC for Thallium is already much higher than the health based number for Thallium (0.0 mg/kg).

Due to the limited presence of Thallium in the area of the site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Thallium at the M-5 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent and compliance averaging approach support a No Further Action determination for Thallium in near-surface soils at the M-5 Landfill Site.

Zinc (AREA METALS-1)

Zinc was detected above the RDCSCC of 1,500 mg/kg in three site soil samples at concentrations ranging from 1,598 mg/kg to 4,510 mg/kg (average exceedence concentration of 9,772 mg/kg). Because the maximum concentration of Zinc was greater than the 2X ceiling limit of 3000 mg/kg in AREA METALS-1, compliance averaging was not appropriate for Zinc for this area of the M-5 Landfill Site.

Due to the limited presence of Zinc in the area of the site identified as AREA METALS-1 at concentrations that are both above the RDCSCC and inappropriate for compliance averaging, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan. The DER equivalent will apply to soils presenting exceedences of Zinc at the M-5 Landfill Site (AREA METALS-1) and will be protective of human health and the environment. The DER equivalent supports a No Further Action determination for Zinc in near-surface soils at the M-5 Landfill Site.

5.0 CONCLUSIONS AND RECOMMENDATIONS

To demonstrate compliance equivalence of the existing soil cover over the M-5 Landfill Site with respect to the Solid Waste Disposal Act of 1965, DPW characterized the near-surface soils using 254 borings from strategic locations over the site. DPW installed soil borings and obtained soil samples between April 1998 and August 1998. All soil samples were analyzed for TCL Organics + 30 parameters and TAL metals. The data that exceeded the laboratory MDL and/or the NJDEP RDCSCC are summarized in table form in this RIR. Where applicable and appropriate, the data were evaluated utilizing the "compliance averaging" approach to determine compliance with NJDEP RDCSCC. The conclusions and recommendations of the evaluation of analytical results from the near-surface soils site characterization are provided below.

As discussed in **Section 4.1**, concentrations of VOCs, SVOCs, pesticides and PCBs and metals were detected exceeding the NJDEP RDCSCC. **Table 4-6** provides a summary of the compliance analysis discussed in this RIR. In all cases, further analysis of the analytical results did not define a "source area" or level of contamination that necessitated the identification and evaluation of potential remedial actions. In most cases, either the calculated compliance average was below the respective RDCSCC or the exceedence was considered marginal (e.g., within 1 to 2 mg/kg of the RDCSCC). However, to address the exceedences of analytes that did not meet cleanup requirements in the near surface soils, the DPW will incorporate a document equivalent to a DER into the Fort Monmouth Master Plan for soils containing these exceedences. As discussed in **Section 2.3.2.**, the M-5 Landfill Site is located within a Class-III-A aquifer (aquitard) zone, which would minimize the possibility of any cantamination migrating offsite. The Army is therefore requesting a ***No Further Action*** for these parameters. The DER equivalent may be developed for the entire M-5 Landfill Site or be restricted to the following areas and analytes (see **Figures 4-1, 4-2**, **4-3** and **4-4** for the boundaries of these areas):

- AREA SVOC-1: Benzo(a)anthracene, Benzo(a)pyrene and Dibenz(a,h)anthracene
- AREA PESTPCB-1: 4,4'-DDT
- AREA METALS-1: Arsenic, Beryllium, Copper, Lead, Thallium and Zinc

Given the inactive and undisturbed status of the landfill, the performance of long-term surface water and groundwater monitoring proximate to the M-5 Landfill Site, the negligible impacts reported to-date, the lack of groundwater use at or downgradient of the M-5 Landfill Site and the relatively low levels of COCs in the shallow surface soils across the site, No Further Action is recommended for the near-surface soils at the M-5 Landfill Site.

NOTES:
ND = Not Detected
NLE = No Limit Established
J = Estimated Value: Mass spectrometer and retention time data indicate the presence of the analyte, however the result is less than the method detection limit, but greater than zero.

ND = Not Detected
NLE = No Limit Established
J = Estimated Value: Mass spectrometer and retention time data indicate the presence of the analyte, however the result is less than the method detection limit, but greater than zero.

Pest/PCBs = Pesticides/Polychlorinated-Biphenyls.
Site Specific Maximum Concentrations were developed by Weston (1995) and may apply to arsenic and thallium in determining whether compliance averaging can be used per NJDEP (Spring 1995).

Table 4-4
Compliance Analysis Method Summary
M-5 Landfill
Fort Monmouth, New Jersey

Analyte Name	Compliance Average Area	RDCSCC	Units	Compliance Analysis Decision
VOCs				
Tetrachloroethene	AREA VOC-1	4	mg/kg	Compliance averaging used.
SVOCs				
Benzo(a)anthracene	AREA SVOC-1	0.9	mg/kg	Compliance averaging not allowed due to exceedance of the ceiling limit of 10X (for criterion<10 ppm).
Benzo(a)pyrene	AREA SVOC-1	0.66	mg/kg	Compliance averaging not allowed due to exceedance of 0.9 ppm limit for Benzo(a)pyrene.
Benzo(b)fluoranthene	AREA SVOC-1	0.9	mg/kg	Compliance averaging used.
Benzo(k)fluoranthene	AREA SVOC-1	0.9	mg/kg	Compliance averaging used.
Chrysene	AREA SVOC-1	9	mg/kg	Compliance averaging used.
Dibenz(a,h)anthracene	AREA SVOC-1	0.66	mg/kg	Compliance averaging not allowed due to exceedance of 0.9 ppm limit for Dibenz(a,h)anthracene.
Indeno(1,2,3-cd)pyrene	AREA SVOC-1	0.9	mg/kg	Compliance averaging used.
Pest/PCBs				
4,4'-DDD	AREA PESTPCB-1	3	mg/kg	Compliance averaging used.
4,4'-DDE	AREA PESTPCB-1	2	mg/kg	Compliance averaging used.
4,4'-DDT	AREA PESTPCB-1	2	mg/kg	Compliance averaging not allowed due to exceedance of the ceiling limit of 10X (for criterion<10 ppm).

Notes:
RDCSCC = Residential Direct Contact Cleanup Criteria pre N.J.A.C. 7:26D.
VOCs = Volatile Organic Compounds; SVOCs = Semi-Volatile Organic Compounds.
Pest/PCBs = Pesticides/Polychlorinated-Biphenyls.
Site Specific Maximum Concentrations were developed by Weston (1995) and may apply to arsenic and thallium in determining whether compliance averaging can be used per NJDEP (Spring 1995).

Table 4-4
Compliance Analysis Method Summary
M-5 Landfill
Fort Monmouth, New Jersey

Analyte Name	Compliance Average Area	RDCSCC	Units	Compliance Analysis Decision
Arochlor 1254	AREA PESTPCB-1	0.49	mg/kg	Compliance averaging used.
Dieldrin	AREA PESTPCB-1	0.042	mg/kg	Compliance averaging used.
Metals				
Arsenic	AREA METALS-1	20	mg/kg	Compliance averaging not allowed due to exceedance of RDCSCC and site-specific maximum (22.9 mg/kg, Weston-1995).
Beryllium	AREA METALS-1	2	mg/kg	Compliance averaging not allowed due to exceedance of 2 mg/kg limit for Beryllium.
Copper	AREA METALS-1	600	mg/kg	Compliance averaging not allowed due to exceedance of the ceiling limit of 2X (for criterion>100 ppm).
Lead	AREA METALS-1	400	mg/kg	Compliance averaging not allowed due to exceedance of the ceiling limit of 2X (for criterion>100 ppm).
Mercury	AREA METALS-1	14	mg/kg	Compliance averaging used.
Nickel	AREA METALS-2	250	mg/kg	Compliance averaging used.
Thallium	AREA METALS-1	2	mg/kg	Compliance averaging not allowed due to exceedance of 2 mg/kg limit for Thallium.
Zinc	AREA METALS-1	1500	mg/kg	Compliance averaging not allowed due to exceedance of the ceiling limit of 2X (for criterion>100 ppm).

Notes:
RDCSCC = Residential Direct Contact Cleanup Criteria pre N.J.A.C. 7:26D.
VOCs = Volatile Organic Compounds; SVOCs = Semi-Volatile Organic Compounds.
Pest/PCBs = Pesticides/Polychlorinated-Biphenyls.
Site Specific Maximum Concentrations were developed by Weston (1995) and may apply to arsenic and thallium in determining whether compliance averaging can be used per NJDEP (Spring 1995).

Re: *November 26, 2014 Response to Comments –on the Final Baseline Ground Water Sampling Report (August 2013)*
Fort Monmouth
Monmouth County
PI # G000000032
Activity Number: RPC000001

Dear Ms. Green:

The New Jersey Department of Environmental Protection (Department) has completed a review of the referenced Response to Comments dated November 26, 2014, submitted in response to the Department's comment letter dated July 3, 2014 regarding the Final Baseline Ground Water Sampling Report.

The *Response to Comments* agrees with or acknowledges the Department's comments for areas FTMM-03, FTMM-04, FTMM-05, FTMM-08, FTMM-12, FTMM-14, FTMM-22, FTMM-25, FTMM-53, FTMM-54, FTMM-55, FTMM-56, FTMM-57, FTMM-58, FTMM-59, FTMM-61, FTMM-64, and FTMM-66.

FTMM-18
The Department had indicated low-flow sampling must also be performed if Passive Diffusion Bag Sampling (PDBS) is conducted, for comparison purposes. The *Response to Comments* submittal contends as low-flow sampling has been historically conducted at this area, PDBS sampling only is appropriate. Based upon this reasoning, the Department agrees the performance via PDBS only is acceptable for the ensuing round of ground water sampling. The PDBS results are to be compared to the previous low-flow sampling results and presented in the forthcoming sampling report.

FTMM-68
The Department had expressed concern regarding the use of PDBS for long-term monitoring. FTMM-68 has not been fully characterized, and the use of PDBS for longer term monitoring is acceptable only for well characterized sites, as per the DEP's Field Sampling Procedures

Manual. As per information provided in the *Response to Comments* submittal, a Remedial Investigation to fully characterize the area is to be conducted in the near future using low-flow sampling methodology, and request approval for the use of PDBS to characterize contaminant concentrations in the interim. This is acceptable based on the stipulation that a full remedial investigation is to be performed. The November '14 *Response to Comments* (Section V), however, indicated the Remedial Investigation Workplan for FTMM-68 was awaiting DEP approval. Although some clarification was requested, the proposed remedial activities, soil and ground water, were approved for the FTMM-68 area via letter dated *January 8, 2014*, which addressed the RI/FS Workplan for FTMM-22, FTMM-53, FTMM-59 & FTMM-68.

If you have any questions, please contact me at (609)984-6606, or via email at Linda.Range@dep.nj.gov.

Sincerely,

Linda Range

1.0 INTRODUCTION

A natural attenuation program with long-term monitoring (LTM) to remediate ground water concentrations exceeding the New Jersey Department of Environmental Protection's (NJDEP's) Ground Water Quality Standards (GWQS) for Class II-A Aquifers at Fort Monmouth, New Jersey is being conducted in accordance with the Remedial Action Work Plans (RAWPs) prepared specifically for individual Sites.

During the performance of LTM, various metals have been detected at concentrations exceeding the NJDEP GWQS. It has been suspected that most of these exceedances are likely due to naturally-occurring background conditions and represent a combination of a natural, dissolved component, along with input from sample turbidity. The lack of a specific source area for the detected contaminants provides confidence that metals detected in ground water are not from contaminants discharged at the site.

The objectives of this evaluation are to (1) document the presence of naturally-occurring metals; (2) identify various conditions which are likely to have resulted in the exceedances identified in the ground water LTM program; and (3) develop a meaningful strategy for determining which sites, and which individual metals, represent site contamination for which the Fort remains responsible.

Specifically, this evaluation encompassed the following:

- Determine factors potentially contributing to exceedances;
- Reference published data sources which documents metals naturally occurring in soils;
- Identify which sites have metal concentrations exceeding the NJDEP GWQS;
- Evaluate site-specific conditions which may impact results; and
- Identify and discuss recommendations for the future sampling and analysis of metals on the Fort, and establish ground water Classification Exception Areas (CEAs).

This evaluation was conducted in general accordance with the NJDEP's *Technical Requirements for Site Remediation* (*TRSR*), N.J.A.C. (New Jersey Administrative Code) 7:26E et seq.

2.0 SITE LOCATION AND DESCRIPTION

Fort Monmouth is located in the central-eastern portion of Monmouth County, New Jersey, approximately 45 miles south of New York City and 70 miles northeast of Philadelphia (Figures 1 and 2). This report covers 23 sections of the base, identified as the following sites: Buildings 80 and 166 (FTMM–56), 108 (FTMM–57), 283 (FTMM–61), 287, 290 (FTMM–55), 296 (FTMM–54), 699 (FTMM–53), 750, 812 (FTMM-64), 886 (FTMM–66), 2567 (FTMM–58), M-2 (FTMM-02), M-3 (FTMM-03), M-4 (FTMM–04), M-5 (FTMM–05), M-8 (FTMM-08), M-12 (FTMM-12), M-14 (FTMM–14), M-18 (FTMM–18), CW-1 (FTMM–22), CW-3A (FTMM–25), and CW-6. These individual sites can be separated into four general usage areas as listed below. This document is not meant to provide detailed historical accounts for the individual sites, as these are provided in site-specific remedial progress documents.

- Historical Landfills – M-2, M-3, M-4, M-5, M-8, M-12, M-14, MP-18, and CW-3A;
- Various Office, Research, Storage, and General Use Buildings – Buildings CW-1, and CW-6 (former pesticide storage facility);
- Underground Storage Tank Sites – Buildings 80 and 166, 108, 283, 287, 290, 296, 750 (motor pool), and 886; and
- Gasoline Service Stations – Buildings 699 and 2567.

Individual sites are shown on the Contaminated Site Location Maps for Main Post and Charles Wood Areas provided as Figures 3 and 4, respectively.

3.0 METALS DETECTED AT CONCENTRATIONS EXCEEDING GWQS

Roy F. Weston, Inc. (Weston) prepared a *Site Investigation Report* (SIR) in December of 1995 entitled *Final Site Investigation, Main Post and Charles Wood Areas, Fort Monmouth, New Jersey*. As part of the SIR for the Fort Monmouth military installation, Weston conducted soil sampling, monitoring well installation activities, ground water sampling, and geophysical surveying. In addition to soil and ground water sampling at different sites throughout the Main Post and Charles Wood Areas of Fort Monmouth, Weston established background concentrations for soil and ground water for the Fort Monmouth installation. These background concentrations have been referenced in various technical submittals and used by the DPW for comparing sampling results for native constituents of soil and ground water.

In the ground water results tables included in the 1995 Weston SIR, Weston identified aluminum (Al), arsenic (As), iron (Fe), manganese (Mn), sodium (Na) and lead (Pb) at concentrations greater than the NJDEP GWQS. Lead was the only constituent which was considered a COC; the remaining metal exceedances were considered background concentrations.

On-going LTM conducted at Fort Monmouth indicated several other metals were detected in ground water at concentrations greater than the GWQS across individual sites on the Fort. Those metals include antimony (Sb), beryllium (Be), cadmium (Cd), chromium (Cr), nickel (Ni), selenium (Se), and thallium (Tl). [Although commonly detected in ground water, barium (Ba) and copper (Cu) rarely exceed the GWQS.]

4.0 FACTORS AFFECTING RESULTS

Numerous factors were identified which could have contributed to the elevated concentrations of metals in ground water samples. These factors are discussed in the sections below.

4.1 Naturally-Occurring Constituents

Metals are naturally-occurring in the environment in rocks, soil, and ground water. Natural background levels are concentrations present in the environment of the region of the site and have not been influenced by anthropogenic activities.

Metals such as antimony, arsenic, barium, beryllium, cadmium, chromium, copper, lead, nickel, selenium, and thallium have all been documented as being naturally-occurring constituents in soil and ground water in the Fort Monmouth area (refer to Section 5.0).

4.2 Sampling Techniques

Prior to 2010, metals at Fort Monmouth were sampled via standard-purge, which evacuates three to five monitoring well volumes prior to sampling. This sampling method potentially increases turbidity in the water column through agitation, and generally results in the introduction of fine particulates (turbidity) into the samples. Resulting analytical concentrations tend to increase as turbidity increases due to sorption of metals on particulates in the water. Metals are also contained within the mineral composition of soils.

Low-flow purging (also known slow-purge) is a method utilized to collect ground water samples from monitoring wells that are more representative of ambient ground water conditions in the aquifer. Essentially, the rate at which water is evacuated from the well is reduced, minimizing the drawdown inside of the well, thereby minimizing disturbance of sediment on the bottom of the well, and within the well gravel pack and surrounding formation. At certain sites, the slow-purge technique effectively reduces turbidity in the resulting samples.

Fort Monmouth sampling personnel have reported highly turbid samples being collected regardless of the sampling technique used. This is most likely as a result of the high percentage of fines present in the formations containing silt and clays.

Regardless of sampling technique, any metals introduced into the sample via turbidity become represented in the analytical results due to the nitric acid preservation required by the laboratory analytical method.

4.3 Well Construction

Similar to the effects of sampling techniques, the quality of individual monitoring well construction can influence analytical results. For example, well screening and filter pack conditions affect the amount of sediment introduced into the ground water sample. The age of the well, number of times sampled, construction materials/techniques, and formation characteristics can affect the amount of fine particulates that are ultimately introduced into the samples.

4.4 Laboratory Errors

During the 2009 ground water sampling events, it was discovered that the Fort Monmouth Environmental Testing Laboratory (FMETL) experienced difficulties in quantifying certain metal results. Specifically, selenium and thallium were not reported due to data quality objectives that were not met in low-range detection of these elements.

As reported by Fort Monmouth DPW, prior to the first quarter 2009, thallium was not identified as a COC in ground water. However, in 2009, thallium was detected in nearly all monitoring wells throughout Fort Monmouth at similar concentrations. Thallium concentrations exceeding the GWQS are thought to be falsely positive due to laboratory instrumentation issues. The results for thallium were not identified in the laboratory non-conformance report since blank samples associated with these results reported thallium concentrations less than the GWQS.

4.5 Factors Affecting Solubility

The pH of soil and ground water may have contributed to increased solubility of metals. Lower pHs (more acidic) could potentially increase the solubility of metals in ground water. As an example, samples collected for metals analysis are preserved with nitric acid to lower the pH to ensure that all of the metals are dissolved and, therefore, reflected in the laboratory analysis.

Temperature, aeration, mineral levels, redox parameters and biological conditions of the soil and ground water are amongst the many variable factors which can affect the solubility of soils in ground water. All of these factors can be dependent upon many other variables (such as pH) and thus it is difficult to quantify how individual site factors can influence metals results at Fort Monmouth.

5.0 PUBLISHED DOCUMENTS

Brinkerhoff reviewed various published documents regarding metals naturally-occurring in the environment. Fort Monmouth conducted their own study under the direction of the NJDEP regarding glauconitic soils to investigate a possible connection to the elevated metal detections in ground water on the installation. This report, including several other sources, are discussed below. Metals in New Jersey soils and ground water, particularly areas with glauconite-rich soils, are prevalent.

5.1 U.S. Army Garrison Fort Monmouth, March 2011, Base-Wide Glauconitic Soil Sampling Report – Fort Monmouth – Main Post Area

The U.S. Army Fort Monmouth, Directorate of Public Works wanted to assess if naturally-occurring glauconitic soils were attributing to the elevated metals detections observed in ground water collected from wells throughout the installation since no documented or confirmed source was identified. This report is included in Appendix A.

Six soil samples were collected from three locations (near Buildings 108, and 296 and historic landfill M-2). Soil results indicate the following metals were detected, however, were below the NJDEP Residential Direct Contact Soil Remediation Standards: aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc.

Six ground water samples were collected from three monitoring wells at a shallow and deep interval via slow-purge sampling technique. Of the six samples, three samples had arsenic concentrations exceed the GWQS and four had lead concentrations exceed the GWQS.

The study found that no direct correlation could be established between the metals concentrations detected in soil and ground water at the sites. However, the highest detections of arsenic and lead concentrations in ground water were detected adjacent to a glauconite-rich soil layer. The Fort Monmouth DPW concluded that arsenic and other trace metals were due to naturally-occurring conditions and not due to a site- specific source based on the lack of a clear distribution gradient and correlation between soil results and ground water results. Additionally, the DPW concluded that sample turbidity was a contributing factor in ground water concentrations in excess of the GWQS, and recommended the inclusion of filtered samples to evaluate the input from sample turbidity.

5.2 Published References

Brinkerhoff reviewed several other reference documents to confirm the natural presence of metals in soils and ground water in New Jersey. Documents reviewed and brief summaries are included below:

- Dooley, 2001, *Baseline Concentrations of Arsenic, Beryllium and Associated Elements in Glauconite and Glauconitic Soils in the New Jersey Coastal Plain*

This study describes how glauconite - a green, iron-rich, mineral occurs in significant concentrations in sedimentary formations of marine origin. These deposits form glauconitic soils from chemical weathering which underlie the New Jersey Coastal Plain physiographic providence.

These soils have been found to contain high concentrations of arsenic and beryllium. Additionally, high median concentrations of antimony, boron, and chromium were observed in glauconite-containing soils.

- Paul F. Sanders, Ph.D., May 2003, *Ambient Levels of Metals in New Jersey Soils*

Three studies conducted between 1996 and 2001 for a research project study by the Environmental Assessment and Risk Analysis Element at the NJDEP determined the ambient levels of extractable metals in New Jersey soils. This project was initiated to assist in the development of soil cleanup criteria, which could not be more stringent than background concentrations.

Aluminum, calcium, iron, magnesium, manganese, potassium, and sodium were abundant with concentrations measured at several hundred to several thousand milligrams per kilogram (mg/kg). Arsenic, barium, chromium, mercury, vanadium, and zinc were common with concentrations ranging between 10 to 100 mg/kg. Beryllium, cobalt, copper, nickel and lead were less common, and antimony, cadmium, selenium, silver, and thallium were detected at trace concentrations.

This study demonstrates that most metals are found in New Jersey soils at detectable concentrations. The metals arsenic and beryllium are the only two metals with soil criterion set by ambient levels in soil, indicating they are commonly encountered.

- Michael Serfes for the New Jersey Geological Survey, 2004, *Arsenic in New Jersey Ground Water*

This article introduces arsenic as a common constituent to New Jersey ground water. Arsenic becomes mobilized in ground water under chemically alkaline and reducing conditions. Certain natural minerals stored in bedrock can weather and be introduced into ground water.

Arsenical pesticides are not very mobile in soils and are not a major source in ground water because they are not very water-soluble and bind tightly to soil particles. However, arsenic naturally found in soils could become water-soluble depending on pH and other factors.

- Princeton Geosciences, Inc., 2007, *Trace Metals Characterization in Glauconitic Coastal Plain Soil and Associated Ground water*

A project by Princeton Geosciences identified arsenic concentrations in soil as great as 100 mg/kg for a site located in the New Jersey Coastal Plain. Samples were collected within a glauconite-containing soil matrix, leading to high concentrations of arsenic. Ground water samples contained trace metals such as aluminum, beryllium, chromium, iron, lead, and manganese. Princeton Geosciences concluded that the elevated concentrations of trace metals were attributed to turbidity in the samples. Further research and statistical evaluation led Princeton Geosciences to conclude that metals were naturally-occurring.

6.0 CONCLUSIONS AND RECOMMENDATIONS

The metals most often reported as exceedances of the applicable GWQS have the following aspects in common:

- They are common in soils, as documented through site-specific analysis and published sources; and
- have very low GWQS, ranging from 1 µg/L for beryllium, upwards to 6 µg/L for antimony.

More than any other factor, turbidity in ground water samples has the capability to result in analytical results exceeding the published GWQS. Due to the interference from sample turbidity, exceedances of the GWQS by dissolved-phase metals is not certain. As the GWQS were developed based on dissolved-phase contaminants, direct comparison to the GWQS frequently results in "false positives" when evaluating site data.

In consideration of the impending closure of Fort Monmouth, the following general recommendations are provided:

- Based on data from the current reporting period (through 3rd Quarter 2010), establish interim ground water Classification Exception Areas (CEAs) for each applicable site. Each CEA should clearly indicate that elevated results are suspected due to sample turbidity.
- The sampling strategy described in Section 7.0 herein should be implemented to reduce the input from sample turbidity, and thus better represent the actual concentrations of dissolved-phase metals. Upon completion of each sampling event, the data should be compared to the GWQS. Metals concentrations laboratory-determined to be in compliance with the GWQS should be removed from further consideration.
- Data generated should be evaluated during the performance of the 2012 CEA Biennial Certification, with metals concentrations laboratory-determined to be in compliance with the GWQS removed from each CEA as needed. Dissolved-phase metals remaining in excess of the GWQS should be evaluated on a site-specific basis to determine whether sources of contamination exist, or the dissolved-phase component is from a natural background condition.

7.0 SAMPLING STRATEGY DEVELOPMENT

In order to reduce the input from sample turbidity, and thus better-represent the actual concentrations of dissolved-phase metals, the following strategy was developed:

- Removal of extreme outliers from the data set using a 90th Percentile Analysis;
- Comparison of 90th percentile values to the applicable GWQS, with parameters exceeding the GWQS retained for further field investigation;
- Selection of monitoring wells at each site for further field investigation, biased towards those with previous elevated results; and
- Development of sample collection methodology, using a combination of slow purge well evacuation, and the use of raw and filtered sample pairs to reduce sample turbidity and enable the comparison between the raw (traditional) and filtered samples to evaluate the contribution from sample turbidity.

Site-specific results of the comparisons and recommended sampling protocol are provided in the Site Specific Evaluations included in Exhibit B of this report. Each Site Specific Evaluation includes a statistical summary of the 90th Percentile Analysis, 90th Percentile Data Summary Table (Table 1), discussion of the recommended sampling protocol, and Concentration Ranking and Recommended Well Sampling Table (Table 2).

7.1 90^{th} Percentile Analysis

Procedure

The 90^{th} Percentile Analysis is a statistical approach which removes data outliers from a data group in order to present a more representative data set. Fort Monmouth personnel assembled the data sets for each applicable site and provided the calculations to Brinkerhoff. Only detections were used in calculations. By only including the detections and not the multitude of samples that were non-detect, this approach provided a more conservative outcome.

Utilizing an Excel spreadsheet, the 90^{th} percentile and mean were calculated for each metal. Concentrations exceeding the 90^{th} percentile were determined to be extreme outliers and were excluded from the data set. An adjusted mean was then calculated.

Metals values were compared to the GWQS at the 90^{th} percentile, then to the mean and finally to the adjusted mean. This data set included various timeframes of sampling events, various numbers of monitoring wells at each site, and various metals. Timeframes were chosen by a Fort Monmouth representative based on a manageable and representative data set starting in the first quarter 2005 through to the third quarter 2010. If data were not available back to the first quarter 2005, the earliest available date was

used. Some sites did not have enough metals data to conduct statistical analysis and were not utilized in this study. These sites included Buildings 707, 745, 1104 and 1122.

Data Evaluation

The data evaluation performed for each site consists of the identification of the following:

- Metals for which the 90th percentile values meet the GWQS;
- Metals for which mean values meet the GWQS; and
- Metals for which the adjusted mean values meet the GWQS.

For the purposes of this analysis, metals with 90th percentile values meeting the GWQS were excluded from further evaluation. Although metals with mean values, or adjusted mean values meeting the GWQS are identified, this comparison is not considered sufficient to exclude these parameters from further investigation.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS for these metals.

Site-specific results of the comparisons are discussed in the Site Specific Evaluations included in Exhibit B of this report.

7.2 Concentration Ranking and Well Selection Protocol

For future sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data (generally from 4th Quarter 2008 through 3rd Quarter 2010), the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. (Each well was counted only once for each parameter of concern.)

The above procedure resulted in a small group of monitoring wells for each applicable site to be sampled using the prescribed protocol.

7.3 Sample Collection Methodology

The proposed sample collection methodology consists of a combination of slow purge well evacuation, and the use of raw and filtered sample pairs to reduce sample turbidity. This approach also enables a comparison between the raw (traditional) and filtered samples to evaluate the contribution from sample turbidity.

Specifically, for future sampling events, raw and filtered water sample pairs should be collected from select wells, to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory for the metals for which the 90th Percentile values do not meet the GWQS. (Refer to the Site Specific Evaluations in Exhibit B for the individual site evaluation and monitoring well selection.)

Slow-purge methodology should be followed for all sampling events which include metals analyses.

7.4 Sample Collection Frequency

Sample collection should generally be performed on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts, and increased likelihood of infiltration to ground water (generally Spring and Fall).

Although precipitation in New Jersey is generally well distributed throughout the year, winter is considered less desirable due to the potential for snow along with a frozen ground surface. Likewise, summer is less desirable due to increased evaporation, increased absorption capacity due to dry soil conditions, and increase use by vegetation.

The semiannual collection protocol is intended to generate sufficient dissolved-phase data to draw meaningful conclusions prior to the 2012 CEA Biennial Certification.

Subject: Base-Wide Glauconitic Soil Sampling Report
Fort Monmouth – Main Post Area
Fort Monmouth, New Jersey 07703

Dear Mr. Quinn:

On October 13, 2010, the U.S. Army Fort Monmouth, Directorate of Public Works (DPW) submitted a *Base-Wide Glauconitic Soil Sampling Plan* to determine if selected Target Analyte List (TAL) metals detected in groundwater at concentrations exceeding the New Jersey Department of Environmental Protection (NJDEP) Ground Water Quality Standards (GWQS) are naturally occurring in soils containing high amounts of glauconite. On October 29, 2010, the NJDEP provided written approval of the *Base-Wide Glauconitic Soil Sampling Plan* **(Attachment 1).**

Background

TAL metals which have been detected in samples collected from onsite groundwater monitoring wells at concentrations exceeding the GWQS include, but are not limited to: arsenic, antimony, beryllium, cadmium, lead, and zinc. There is no documented or confirmed source identified for the detections of these metals in groundwater. Several sites at Fort Monmouth are solid waste landfills containing various materials but most sites are associated with petroleum hydrocarbons resulting from leaking underground storage tanks (USTs).

Dooley (2001) analyzed the composition of naturally-occurring glauconitic soils at seven locations within the New Jersey Coastal Plain physiographic province. This study revealed that glauconitic soils contained arsenic at concentrations ranging from 7 to 31 milligrams per kilogram (mg/kg). There is evidence for a relationship between the type of geologic unit and concentrations of arsenic in the soil found in the New Jersey Coastal Plain (Rutgers, 2002). The geologic creation of arsenic-bearing glauconite is the result of depositions of algae that take up, metabolize, and retain arsenic in surface waters. When the algae dies and settles to the bottom, the arsenic in the dead algae becomes part of the deposit. When this process occurs over thousands of years, arsenic accumulates in estuaries, which are now geologically mapped as glauconite or "greensands". Glauconite is a dull-green, iron-silicate mica mineral found in shallow marine sediments.

Layers of glauconite have been identified in the New Jersey Coastal Plain, southern New Castle County, Delaware, and in the deeper units in southern Delaware. The soils that form over these glauconite-containing units, called greensands, are highly productive agriculturally and have

been determined to contain naturally-occurring arsenic and beryllium as reported by Dooley (2001).

The United States Geological Survey (USGS) reported arsenic concentrations ranging from 4.8 to 23 mg/kg in sediments collected from the Lower Susquehanna River. Similar concentrations of arsenic were found in another USGS study in which the average arsenic soil concentrations were reported as 8.3 mg/kg for New Castle County, Delaware, 4.6 mg/kg for Kent County, Delaware, and 4.9 mg/kg for Sussex County, New Jersey (USGS, 1984).

These studies indicate that the presence of arsenic and other TAL metals (e.g., beryllium, lead) detected in soil and sediment samples are attributed to natural (lithogenic) sources rather than from anthropogenic activities. In an effort to confirm and document that select TAL metals detected in groundwater on the Main Post are naturally associated with glauconitic soils, the DPW conducted a soil sampling investigation. This investigative study was necessary because the DPW believes the presence of naturally-occurring TAL metals in onsite glauconitic soils are adversely affecting groundwater quality conditions as defined by the NJDEP GWQS.

The DPW conducted an exhaustive review of all logs for monitoring wells installed at the Main Post to identify locations where the word 'glauconitic' or variations thereof (e.g. glauconite, green sands) were recorded. Glauconitic sands, silts, and/or clays were positively identified at sites 108, 296, and the M-2 Landfill. A brief summary of each site as described in the U.S. Army's *Environmental Condition of Property Report* (2007) is provided as follows:

- **Site 108** is near Riverside Avenue in the eastern section of the Main Post. The DPW removed five USTs in this area in November 1993. The site was reported to the NJDEP as a discharge to the environment and Incident No. 93-04-12-1939-29 was assigned.

- **Site 296** a former fuel distribution facility on Sherrill Avenue which was abandoned and then rediscovered during a renovation project at Building 296. The facility dates back to the 1940s. The UST system was comprised of ten 1,000-gallon USTs which stored various types of fuel products. These products were distributed from remote pumping islands located >450 feet from the UST field and within 50 feet of Parkers Creek.

- **M-2 Landfill**. The 6.5-acre landfill operated from 1964 until 1968. Materials disposed at the landfill reportedly included: construction debris, scrap metal, asbestos containing materials, vegetative waste, unwashed containers which previously held hazardous materials/wastes, outdated photographic chemicals, small quantities of outdated drugs, sludge from the STP, soot and boiler scale, incinerator ash, oil spill debris, oil filters, batteries, fluorescent tubes, and electronic components.

At each of the above locations, arsenic and lead were detected in groundwater at concentrations exceeding the GWQS of 3 and 5 micrograms per liter (µg/L), respectively. It is important to note that glauconitic-rich soils are more prevalent on the Main Post than the well logs would indicate because the well logs were not properly completed by trained personnel, e.g., soil scientist, geologist, etc. The majority of the well logs were prepared by the well drillers who have little to no training properly classifying soils using an accepted classification scheme (i.e. Unified Soil Classification System, Burmister, etc.).

According to Jablonski (1968), the Cretaceous-age Red Bank and Tinton Sands outcrop at the Main Post. The Red Bank sand conformably overlies the Navesink Formation. The upper member of the Red Bank Sand (Shrewsbury) is a yellowish-gray to reddish-brown, clayey, medium to coarse-grained sand that contains abundant rock fragments, muscovite, and glauconite. The lower member (Sandy Hook) is a dark gray to black, medium to fine-grained sand with abundant clay, muscovite and glauconite.

The Tinton Sand conformably overlies the Red Bank sand and ranges from a clayey medium to very coarse-grained feldspathic quartz and glauconitic coarse sand. The color varies from a yellowish-orange or light brown to light olive to grayish-olive. Glauconite may comprise 60 to 80% of the sand fraction in the upper portion of the Tinton Sand (Minard, 1969).

Soil and Groundwater Investigation

The soil investigation included the collection of soil samples at locations depicted on **Figure 1**. Each soil boring was advanced proximate, but not less than five feet, to the selected groundwater monitoring well where glauconite was observed during well installation activities. Geologic logs, including construction details, for the selected groundwater monitoring wells (108MW04, 296MW04, M2MW13, M2MW18, and M2MW24) are provided in **Attachment 2.**

At each soil boring, a direct-push rig (Geoprobe®) was used to advance a borehole to the depth of the proximate groundwater monitoring well. Continuous soil cores were collected by advancing dedicated acetate sleeves from the ground surface to the depth of the proximate groundwater monitoring well. Discrete soil samples from the saturated zone (water table to the bottom of the well screen as determined from the proximate monitoring well) were collected for laboratory analysis. Additional discrete soil samples were collected from the saturated zone for laboratory analysis based on lithology differing from that containing greenish glauconitic sands and silts. Prior to sample collection, any twigs, roots, and miscellaneous debris (e.g. glass, bricks, etc.) were removed from the soil sample using a decontaminated stainless steel spoon. Soil boring logs and maps showing locations of the soil borings are provided in **Attachment 3.**

All method(s)/procedure(s) for collecting grab soil samples were consistent with the methodology for obtaining Non-Volatile Organic Compound Sample Collection for Soils as per NJDEP's August 2005 *Field Sampling Procedures Manual* (Section 6.2.8). Decontamination of field sampling equipment was conducted in accordance with the DPW's *Standard Operating Procedures* (SOP) and NJDEP's August 2005 *Field Sampling Procedures Manual* (FSPM).

Subsequent to the collection of soil samples, groundwater samples were collected from the proximate monitoring well via the low-flow purging and sampling method. Applicable protocols regarding sampling, handling, storage, preservation, reporting, decontamination of field equipment, and other procedures adhered to the DPW's latest SOP for low-flow groundwater sampling (**Attachment 4**), which complies with the NJDEP FSPM.

All soil and groundwater samples were analyzed at DPW's NJDEP certified laboratory (NJDEP Certification Number 13461) for Target Analyte List (TAL) metals and Accutest Laboratories (NJDEP Certification Number 12129) for Organic Carbon (OC) using United States Environmental Protection Agency approved test methods. Soil samples were analyzed for OC not as part of the glauconitic study. Rather the OC data was used to support the fate and transport modeling effort being conducted by Brinkerhoff Environmental Services, Inc. on the Main Post.

Summary of Soil Results

A total of six soil samples were collected at three locations, namely at locations proximate to groundwater monitoring wells M2MW13, 108MW04, and 296MW06 (**Table 1**). Soil samples were not collected as proposed at M2MW18 and M2MW24 due to refusal at each location.

A review of analytical results indicates that the following metals were detected in the soil samples: aluminum (Al), antimony (Sb), arsenic (As), barium (Ba), beryllium (Be), cadmium (Cd), calcium, chromium (Cr), cobalt, copper, iron, lead, magnesium, manganese (Mn), mercury, nickel (Ni), potassium, silver (Ag), vanadium (V), and zinc (Zn). Selenium, sodium, and thallium were not detected in all soil samples.

Arsenic concentrations were detected at all locations and sample depths. Concentrations of arsenic in samples collected from Sites M-2 and 296 were consistent. Concentrations of arsenic at M-2 and 296 in the shallow (non-glauconitic layer) soil samples were 7 and 5 milligrams/kilogram (mg/kg), respectively. Similarly, concentrations of arsenic at M-2 and 296 in the deeper (glauconite-rich layer) soil samples were 7 and 6 mg/kg, respectively. At Site 108, the concentration of arsenic in the soil sample collected 7.0-8.0 feet below ground surface (bgs) was five times greater than the arsenic concentration in the shallower sample (**Table 1**). Concentrations of TAL metals in the shallow soil samples were within an order of magnitude of concentrations of TAL metals detected in the deeper soil samples (**Table 1**). All TAL metal concentrations were compliant with the NJDEP Soil Remediation Standards (SRS) as promulgated by the NJDEP in June 2008 (New Jersey Administrative Code 7:26D). The laboratory analytical reports are included in **Attachment 5**.

Summary of Groundwater Results

Six groundwater samples were collected from three monitoring wells, namely M2MW13, 108MW04, and 296MW06. Aqueous samples were collected at two different depths as noted in **Table 2**.

A comparison of TAL metal concentrations in the shallow and deep sampling depths show variations but are within an order of magnitude. Arsenic concentrations were detected at all three locations and sample depths. Concentrations of arsenic detected in groundwater samples ranged from 2.21 to 8.77 µg/L. The GWQS for arsenic is 3 µg/L. Arsenic concentrations exceeded the GWQS in three of the six groundwater samples. Concentrations of arsenic were nearly consistent

at both sampling depth intervals at M2MW13 (**Table 2**). The concentration of arsenic reported in the water sample collected from 296MW06 at 3.7 feet bgs (4.38 µg/L) was greater than the arsenic concentration detected in the deeper sample (2.69 µg/L at 12.25 feet bgs). Conversely, the arsenic concentration detected at 6.75 feet bgs at 108MW04 (4.94 µg/L) was less than the arsenic concentration detected in the water sample collected from 7.5 feet bgs (8.77 µg/L). The laboratory analytical reports are included in **Attachment 6**.

ND: not detected. Concentrations in **bold** type exceed the GWQS.

It appears a correlation exists between the concentrations of arsenic and lead in groundwater, i.e., the concentrations of arsenic and lead are directly proportional to each other. To determine if the concentrations of arsenic and lead are related to each other, a geochemical association was conducted. To illustrate this, the concentration of arsenic in each groundwater sample was plotted against the corresponding concentration of lead to generate an "Arsenic-Lead" scatter plot (**Figure 1**).

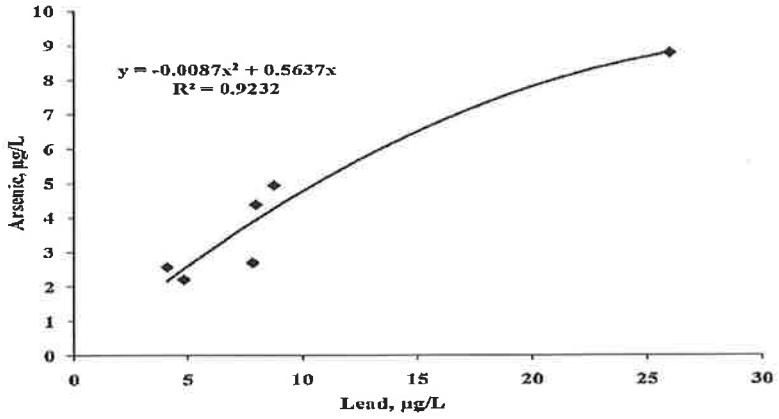

Figure 1. Scatter plot of arsenic and lead concentrations detected in groundwater.
As this figure shows, the concentration of arsenic increases with increases in the lead concentration. A second-order trendline was fitted to the data. The goodness of fit result of R^2 = 0.9232 demonstrates a strong relationship between arsenic and lead given the limited data set.

Thus, it appears that arsenic and lead co-exist as naturally occurring TAL metals, i.e. both metals are non-site related COCs.

Comparison of Arsenic and Lead in Soil and Groundwater

A comparison of TAL metals concentrations in soil and groundwater was completed and no relationship or correlation could be established. In other words, arsenic and lead concentrations in soil are not proportional or inversely proportional to the concentrations of TAL metals identified in groundwater.

Similar to DPW's investigation, Princeton Geoscience, Inc. (PGI) performed a soil and groundwater remedial investigation at a site in the New Jersey Coastal Plain (http://www.princetongeoscience.com/geonew.html). PGI identified natural arsenic concentrations in soil at concentrations up to 100 mg/kg. The elevated metals concentrations in collected groundwater samples resulted mainly from turbidity introduced into the monitoring wells during purging. Low-flow purging and monitoring well redevelopment did not eliminate turbidity in the groundwater samples.

After employing a different approach/technique, PGI compared groundwater concentrations of the trace metals to trace metal concentrations in soil NJDEP acknowledged were of naturally-occurring and identified a correlation for each of the trace metals in question. PGI states that "no remediation has been required to address this issue and Princeton Geoscience has indicated an intention not to include metals as groundwater contaminants in the Classification Exception Area information to be submitted for this site."

Summary

- Arsenic was detected in groundwater at concentrations exceeding the GWQS of 3 µg/L in three of six samples (50%).
- Lead was detected in groundwater at concentrations exceeding the GWQS of 5 µg/L in four of six samples (67%).
- The greatest concentrations of arsenic and lead in groundwater were detected adjacent to the glauconite-rich soil layer at monitoring well 108MW04 (7.5 feet bgs).
- Similarly, the greatest concentrations of arsenic (15 mg/kg) and lead (16 mg/kg) in soil were detected in a sample collected from the glauconitic-rich soil layer proximate to monitoring well 108MW04 (15 mg/kg at 7.0-8.0 feet bgs). Lead was also detected at the same concentration in the shallower soil sample depth (6.5-7.0 feet bgs).
- The greatest concentrations of arsenic in soil were identified at Site 108 where underground storage tanks used to store petroleum products were removed. Arsenic is not associated with refined petroleum products.
- A comparison of TAL metals concentrations in soil and groundwater was completed and no relationship or correlation could be established.

Conclusions

- Given that arsenic was detected at concentrations exceeding the GWQS, this confirms DPW's conclusion in Versar's *Remedial Investigation Report* (2004) that "... arsenic is likely attributable to the native soil characteristics or a non-point source distributed throughout the subsurface soils at Site 108."
- Based on a general knowledge of site historical operations and geology of the Fort Monmouth area, the presence of arsenic and lead co-exist as naturally-occurring TAL metals that are unrelated to anthropogenic activities at the three sites that were investigated.

- It appears arsenic and lead co-exist as naturally occurring TAL metals, i.e. neither metal has been detected and confirmed or documented from a source at any site.
- It appears that the source of arsenic in groundwater is due to natural conditions rather than man-made/anthropogenic sources. Vowinkel et al. (2001) reported that arsenic concentrations greater than 50 µg/L are typically are associated with known contaminated sites. The greatest concentration of arsenic identified in this study is 8.77 µg/L.

Recommendations

- To determine if suspended particles (turbidity) is proportional to detectable concentrations of metals in aqueous samples, filtered and unfiltered samples should be collected and analyzed for TAL metals by a NJ certified laboratory. Filtered samples should provide more consistent analytical results and be more representative of the water quality moving within a water-bearing zone.
- Samples of the glauconite should be collected and chemically analyzed by a certified laboratory for TAL metals to determine if arsenic and other TAL metals are present in its chemical makeup (source material).

RE: Base-Wide Glauconitic Soil Sampling Plan
Fort Monmouth, NJ

Dear Mr. Fallon:

The NJDEP Site Remediation Program (SRP) has received and reviewed the revised Base-Wide Glauconitic Soil Sampling Plan dated October 13, 2010. The stated intent of the Base-Wide Glauconitic Soil Sampling Plan is to "confirm and document that select TAL metals detected in groundwater on the Main Post are naturally associated with glauconitic soils".

As you know, SRP reviewed prior versions of the sampling plan and provided comments, primarily about the compositing of soil samples. We have also discussed the sampling plan with Chuck Appleby and John Montgomery of your staff. SRP believes that the proposed soil and ground water sampling procedures and methodologies are now technically correct. As such, we are willing to take the results of the proposed sampling into consideration. However, that is not an assurance that we will concur with the conclusions that Fort Monmouth draws from the investigation, or that the results of the proposed glauconitic soil sampling will be a significant factor in any remedial decisions.

You or your staff may contact me at 609-633-0766 with any questions on the enclosed comments, or any other site remediation matters at Fort Monmouth.

Sincerely,

Larry Quinn

Larry Quinn, P.E., Site Manager
Bureau of Investigation, Design and Construction

Exhibit B
Site Specific Evaluations

SITE SPECIFIC EVALUATION
BUILDINGS 80 AND 166 (FTMM-56)

Sites 80 and 166 were grouped together because their close proximity to each other and minimal number of wells. Site data and 90th Percentile calculations are provided on Table 1 (attached), and summarized as follows:

90th Percentile Analysis Summary
Buildings 80 and 166

80-166	Sb	As	Ba	Be	Cd	Cr	Cu	Pb	Ni	Se*	Tl*
Feb '05 - Aug '10	n=42	n=96	n=157	n=53	n=104	n=80	n=116	n=37	n=108	n=68	n=3
90th Percentile	12.3	28.7	124.1	2.2	5.1	9.4	9.0	9.1	10.9	27.3	3.4
Mean	8.1	12.4	69.5	1.1	3.9	4.7	5.9	5.8	5.9	13.7	2.4
Adjusted Mean	7.05	9.06	48.0	0.76	1.4	2.0	4.7	4.0	4.3	9.2	1.6
NJDEP GWQS (ug/L)	**6**	**3**	**6000**	**1**	**4**	**70**	**1300**	**5**	**100**	**40**	**2**

Results reported in µg/L or parts per billion. Shaded cells indicate values that exceed the GWQS. "n" = population size in the statistical analysis. As a conservative measure, non-detectable results were not included in the statistical analysis, and thus the population size may be biased low when compared to the total number of data points. * Due to possible laboratory inaccuracies, the 90th Percentile Analysis was not used in developing sampling recommendations for these parameters.

90th Percentile Values Meet GWQS:

The 90th percentile values for barium, chromium, copper, nickel, and selenium are below their respective GWQS.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Mean Values, or Adjusted Mean Values, Meet GWQS:

The mean value for cadmium is below its GWQS.

The adjusted mean values for beryllium, lead, and thallium are below their respective GWQS.

Recommendations:

In consideration of the above, the following sampling protocol is recommended for this site:

1. Selenium and Thallium - Due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Evaluation of the 4th Quarter 2010 and 1st Quarter 2011 sampling should be performed to determine compliance with the GWQS. If exceedances of the GWQS are identified, the sampling protocol specified under item 3 below should be followed.

2. With the exception of selenium and thallium (addressed above), no further sampling/analysis is recommended for metals with 90th percentile values below their respective GWQS.

3. For remaining metals, the collection of ground water samples using the following sampling protocol is recommended.

Collection of samples on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts (generally 2nd and 4th quarters).

For future sampling events, raw and filtered water sample pairs should be collected from select wells (identified below), to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory. Slow-purge methodology should be followed for all sampling events which include metals analyses. Refer to the Concentration Ranking and Monitoring Well Selection Protocol described below.

Concentration Ranking and Monitoring Well Selection Protocol

For the specified sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data from 4th Quarter 2008 through 3rd Quarter 2010, the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. Concentration Rankings and Recommended Well Sampling are summarized in Table 2 (attached).

Based on the specified protocol, monitoring wells 80MW01, 80MW02, and 80MW05 are recommended for sampling with laboratory analysis for antimony, arsenic, beryllium, cadmium, and lead, along with selenium and thallium as required.

Notes:

Adjusted mean does not include metal concentrations that exceed the 90th Percentile

1) Concentrations bolded and italicized exceed applicable Ground Water Quality Standard (GWQS)
2) Concentrations bolded and italicized in red exceed applicable GWQS and the 90th Percentile
3) Concentrations highlighted in red cells exceed exceed the 90th Percentile and are deemed to be extreme outliers
4) Samples highlighted in yellow contain two or more metal concentrations that exceed the 90th Percentile
5) Blank cells indicate metals were not detected, not analyzed, or not reported due to instrument errors

M: Metal detected in method blank

* Sample contains two or more metals at concentrations exceeding the 90th Percentile

Notes:

Results reported in µg/L.

Within the reporting period, the two highest concentrations are listed for each parameter.

Shaded rows indicate monitoring wells recommended for metals analysis.

Metals were analyzed during the entire reporting period, 4th Quarter 2008 through 3rd Quarter 2010.

*Based on results from the 4th Quarter 2010 and 1st Quarter 2011 sampling events, analysis of Selenium and Thallium may be required.

SITE SPECIFIC EVALUATION
BUILDING 108 (FTMM-57)

Site data and 90th Percentile calculations are provided on Table 1 (attached), and summarized as follows:

90th Percentile Analysis Summary
Building 108

108	Sb	As	Ba	Be	Cd	Cr	Cu	Pb	Ni	Se*	Tl*
Jan 05 - Aug 10	n=41	n=86	n=112	n=41	N=49	n=90	n=103	n=79	n=68	n=55	n=0
90th Percentile	11.4	32.0	55.1	0.4	1.6	24.0	29.7	16.1	5.6	80.0	NR
Mean	6.8	13.8	34.2	0.3	0.8	9.8	13.1	7.7	2.5	23.8	NR
Adjusted Mean	5.8	8.9	30.0	0.2	0.6	5.7	9.4	6.1	2.1	14.6	NR
NJDEP GWQS (ug/L)	**6**	**3**	**6000**	**1**	**4**	**70**	**1300**	**5**	**100**	**40**	**2**

Results reported in µg/L or parts per billion. Shaded cells indicate values that exceed the GWQS. "n" = population size in the statistical analysis. As a conservative measure, non-detectable results were not included in the statistical analysis, and thus the population size may be biased low when compared to the total number of data points. * Due to possible laboratory inaccuracies, the 90th Percentile Analysis was not used in developing sampling recommendations for these parameters.

90th Percentile Values Meet GWQS:

The 90th percentile values for barium, beryllium, cadmium, chromium, copper, and nickel are below their respective GWQS.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Mean Values, or Adjusted Mean Values, Meet GWQS:

The mean value for selenium is below its GWQS.

The adjusted mean value for antimony is below its GWQS.

Recommendations:

In consideration of the above, the following sampling protocol is recommended for this site:

1. Selenium and Thallium - Due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Evaluation of the 4th Quarter 2010 and 1st Quarter 2011 sampling should be performed to determine compliance with the GWQS. If exceedances of the GWQS are identified, the sampling protocol specified under item 3 below should be followed.

2. With the exception of selenium and thallium (addressed above), no further sampling/analysis is recommended for metals with 90th percentile values below their respective GWQS.

3. For remaining metals, the collection of ground water samples using the following sampling protocol is recommended.

Collection of samples on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts (generally 2nd and 4th quarters).

For future sampling events, raw and filtered water sample pairs should be collected from select wells (identified below), to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory. Slow-purge methodology should be followed for all sampling events which include metals analyses. Refer to the Concentration Ranking and Monitoring Well Selection Protocol described below.

Concentration Ranking and Monitoring Well Selection Protocol

For the specified sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data from 4th Quarter 2008 through 3rd Quarter 2010, the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. Concentration Rankings and Recommended Well Sampling are summarized in Table 2 (attached).

Based on the specified protocol, monitoring wells 108MW01, 108MW02, 108MW03, and 108MW04 are recommended for sampling with laboratory analysis for antimony, arsenic, and lead, along with selenium and thallium as required.

		Adjusted Mean	5.8	8.9	30.0	0.2	0.6	5.7	9.4	6.1	2.1	14.6

Notes: Adjusted mean does not include metal concentrations that exceed the 90th Percentile
1) Concentrations bolded and italicized exceed applicable Ground Water Quality Standard (GWQS)
2) Concentrations bolded and italicized in red exceed applicable GWQS and the 90th Percentile
3) Concentrations highlighted in red cells exceed exceed the 90th Percentile and are deemed to be extreme outliers
4) Samples highlighted in yellow contain two or more metal concentrations that exceed the 90th Percentile
5) Blank cells indicate metals were not detected, not analyzed, or not reported due to instrument errors
M: Metal detected in method blank
* Sample contains two or more metals at concentrations exceeding the 90th Percentile

Table 2
Building 108
Concentration Rankings and Recommended Monitoring Well Sampling
4th Quarter 2008 - 3rd Quarter 2010

Well ID	Antimony	Arsenic	Lead	Selenium	Thallium
	NJDEP GWQS	*NJDEP GWQS*	*NJDEP GWQS*	*NJDEP GWQS*	*NJDEP GWQS*
	6	*3*	*5*	*40*	*2*
108MW01			30.8	*	*
108MW02	18.2	81.2		*	*
108MW03	19.5	124		*	*
108MW04			25.1	*	*

Notes:

Results reported in µg/L.

Within the reporting period, the two highest concentrations are listed for each parameter.

Shaded rows indicate monitoring wells recommended for metals analysis.

Metals were analyzed during the entire reporting period, 4th Quarter 2008 through 3rd Quarter 2010.

*Based on results from the 4th Quarter 2010 and 1st Quarter 2011 sampling events, analysis of Selenium and Thallium may be required.

SITE SPECIFIC EVALUATION
BUILDING 283 (FTMM-61)

Site data and 90th Percentile calculations are provided on Table 1 (attached), and summarized as follows:

NJDEP GWQS (ug/L)	**6**	**3**	**6000**	**1**	**4**	**70**	**1300**	**5**	**100**	**40**	**2**

Results reported in µg/L or parts per billion. Shaded cells indicate values that exceed the GWQS. "n" = population size in the statistical analysis. As a conservative measure, non-detectable results were not included in the statistical analysis, and thus the population size may be biased low when compared to the total number of data points. * Due to possible laboratory inaccuracies, the 90th Percentile Analysis was not used in developing sampling recommendations for these parameters.

90th Percentile Values Meet GWQS:

The 90th percentile values for barium, cadmium, chromium, copper, nickel, selenium, and thallium are below their respective GWQS.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Mean Values, or Adjusted Mean Values, Meet GWQS:

The mean value for antimony and beryllium are below their respective GWQS.

Recommendations:

In consideration of the above, the following sampling protocol is recommended for this site:

1. Selenium and Thallium - Due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Evaluation of the 4th Quarter 2010 and 1st Quarter 2011 sampling should be performed to determine compliance with the GWQS. If exceedances of the GWQS are identified, the sampling protocol specified under item 3 below should be followed.

2. With the exception of selenium and thallium (addressed above), no further sampling/analysis is recommended for metals with 90th percentile values below their respective GWQS.

3. For remaining metals, the collection of ground water samples using the following sampling protocol is recommended.

Collection of samples on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts (generally 2nd and 4th quarters).

For future sampling events, raw and filtered water sample pairs should be collected from select wells (identified below), to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory. Slow-purge methodology should be followed for all sampling events which include metals analyses. Refer to the Concentration Ranking and Monitoring Well Selection Protocol described below.

Concentration Ranking and Monitoring Well Selection Protocol

For the specified sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data from 4th Quarter 2008 through 3rd Quarter 2010, the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. Concentration Rankings and Recommended Well Sampling are summarized in Table 2 (attached).

Based on the specified protocol, monitoring wells 283MW01, 283MW02, 283MW03, 283MW04, and 283MW05 are recommended for sampling with laboratory analysis for antimony, arsenic, beryllium, and lead, along with selenium and thallium as required.

NOTE: Above sampling does not include additional wells recommended for installation.

Notes:

Results reported in µg/L.

Within the reporting period, the two highest concentrations are listed for each parameter.

Shaded rows indicate monitoring wells recommended for metals analysis.

Metals were analyzed during the following quarters: 4th Quarter 2008 through 3rd Quarter 2010.

*Based on results from the 4th Quarter 2010 and 1st Quarter 2011 sampling events, analysis of Selenium and Thallium may be required.

SITE SPECIFIC EVALUATION
BUILDING 287

Site data and 90th Percentile calculations are provided on Table 1 (attached), and summarized as follows:

90th Percentile Analysis Summary
Building 287

287	Sb	As	Ba	Be	Cd	Cr	Cu	Pb	Ni	Se*	Tl*
Feb 05 - Sept 10	n=4	n=5	n=5	n=0	n=0	n=0	n=5	n=2	n=4	n=1	n=0
90th Percentile	13.6	8.6	58.8	NR	NR	NR	4.9	NR	1.6	1.8	NR
Mean	10.2	5.7	41.9	NR	NR	NR	3.5	NR	1.2	1.8	NR
Adjusted Mean	9.0	5.0	34.0	NR	NR	NR	3.1	NR	1.1	1.8	NR
NJDEP GWQS (ug/L)	**6**	**3**	**6000**	**1**	**4**	**70**	**1300**	**5**	**100**	**40**	**2**

Results reported in µg/L or parts per billion. Shaded cells indicate values that exceed the GWQS. "n" = population size in the statistical analysis. As a conservative measure, non-detectable results were not included in the statistical analysis, and thus the population size may be biased low when compared to the total number of data points. * Due to possible laboratory inaccuracies, the 90th Percentile Analysis was not used in developing sampling recommendations for these parameters.

90th Percentile Values Meet GWQS:

The 90th percentile values for barium, copper, nickel, and selenium are below their respective GWQS.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Recommendations:

In consideration of the above, the following sampling protocol is recommended for this site:

1. Selenium and Thallium - Due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Evaluation of the 4th Quarter 2010 and 1st Quarter 2011 sampling should be performed to determine compliance with the GWQS. If exceedances of the GWQS are identified, the sampling protocol specified under item 3 below should be followed.

2. With the exception of selenium and thallium (addressed above), no further sampling/analysis is recommended for metals with 90th percentile values below their respective GWQS.

3. For remaining metals, the collection of ground water samples using the following sampling protocol is recommended.

Collection of samples on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts (generally 2nd and 4th quarters).

For future sampling events, raw and filtered water sample pairs should be collected from select wells (identified below), to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory. Slow-purge methodology should be followed for all sampling events which include metals analyses. Refer to the Concentration Ranking and Monitoring Well Selection Protocol described below.

Concentration Ranking and Monitoring Well Selection Protocol

For the specified sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data from 4th Quarter 2008 through 3rd Quarter 2010, the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. Concentration Rankings and Recommended Well Sampling are summarized in Table 2 (attached).

Based on the specified protocol, monitoring well 287MW01 is recommended for sampling with laboratory analysis for antimony and arsenic, along with selenium and thallium as required.

Adjusted Mean	6.31	10.53	25.4	0.19	1.59	2.34	5.1	6.97	5.6	10.2	1.5
NJDEP GWQS (ug/L)	**6**	**3**	**6000**	**1**	**4**	**70**	**1300**	**5**	**100**	**40**	**2**

Results reported in µg/L or parts per billion. Shaded cells indicate values that exceed the GWQS. "n" = population size in the statistical analysis. As a conservative measure, non-detectable results were not included in the statistical analysis, and thus the population size may be biased low when compared to the total number of data points. * Due to possible laboratory inaccuracies, the 90th Percentile Analysis was not used in developing sampling recommendations for these parameters.

90th Percentile Values Meet GWQS:

The 90th percentile values for barium, beryllium, chromium, copper, and nickel are below their respective GWQS.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Mean Values, or Adjusted Mean Values, Meet GWQS:

The mean values for selenium and thallium are below their respective GWQS.

The adjusted mean value for cadmium is below its GWQS.

Recommendations:

In consideration of the above, the following sampling protocol is recommended for this site:

1. Selenium and Thallium - Due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Evaluation of the 4th Quarter 2010 and 1st Quarter 2011 sampling should be performed to determine compliance with the GWQS. If exceedances of the GWQS are identified, the sampling protocol specified under item 3 below should be followed.

2. With the exception of selenium and thallium (addressed above), no further sampling/analysis is recommended for metals with 90th percentile values below their respective GWQS.

3. For remaining metals, the collection of ground water samples using the following sampling protocol is recommended.

Collection of samples on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts (generally 2nd and 4th quarters).

For future sampling events, raw and filtered water sample pairs should be collected from select wells (identified below), to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory. Slow-purge methodology should be followed for all sampling events which include metals analyses. Refer to the Concentration Ranking and Monitoring Well Selection Protocol described below.

Concentration Ranking and Monitoring Well Selection Protocol

For the specified sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data from 4th Quarter 2008 through 3rd Quarter 2010, the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. Concentration Rankings and Recommended Well Sampling are summarized in Table 2 (attached).

Based on the specified protocol, monitoring wells 296MW02, 296MW03, 296MW04, 296MW06, and 296MW08 are recommended for sampling with laboratory analysis for antimony, arsenic, cadmium, and lead, along with selenium and thallium as required.

Notes:

Results reported in µg/L.

Within the reporting period, the two highest concentrations are listed for each parameter.

Shaded rows indicate monitoring wells recommended for metals analysis.

Metals were analyzed during the entire reporting period, 4th Quarter 2008 through 3rd Quarter 2010.

*Based on results from the 4th Quarter 2010 and 1st Quarter 2011 sampling events, analysis of Selenium and Thallium may be required.

SITE SPECIFIC EVALUATION
BUILDING 699 (FTMM-53)

Site data and 90th Percentile calculations are provided on Table 1 (attached), and summarized as follows:

90th Percentile Analysis Summary
Building 699

699	Sb	As	Ba	Be	Cd	Cr	Cu	Pb	Ni	Se*	Tl*
March 10 - Sept 10	n=31	n=32	n=17	n=37	n=31	n=20	n=12	n=11	n=44	n=5	n=0
90th Percentile	14.0	9.6	154.6	2.8	7.1	35.0	12.5	29.3	48.6	2.7	NR
Mean	9.2	3.9	84.5	1.4	3.2	14.2	6.7	12.0	72.9	2.2	NR
Adjusted Mean	8.5	2.2	56.8	0.9	1.9	7.0	5.3	10.1	15.8	2.1	NR
NJDEP GWQS (ug/L)	**6**	**3**	**6000**	**1**	**4**	**70**	**1300**	**5**	**100**	**40**	**2**

Results reported in µg/L or parts per billion. Shaded cells indicate values that exceed the GWQS. "n" = population size in the statistical analysis. As a conservative measure, non-detectable results were not included in the statistical analysis, and thus the population size may be biased low when compared to the total number of data points. * Due to possible laboratory inaccuracies, the 90th Percentile Analysis was not used in developing sampling recommendations for these parameters.

90th Percentile Values Meet GWQS:

The 90th percentile values for barium, chromium, copper, nickel, and selenium are below their respective GWQS.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Mean Values, or Adjusted Mean Values, Meet GWQS:

The mean value for cadmium is below its GWQS.

The adjusted mean values for arsenic and beryllium are below their respective GWQS.

Recommendations:

In consideration of the above, the following sampling protocol is recommended for this site:

1. Selenium and Thallium - Due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Evaluation of the 4th Quarter 2010 and 1st Quarter 2011 sampling should be performed to determine compliance with the GWQS. If exceedances of the GWQS are identified, the sampling protocol specified under item 3 below should be followed.

2. With the exception of selenium and thallium (addressed above), no further sampling/analysis is recommended for metals with 90th percentile values below their respective GWQS.

3. For remaining metals, the collection of ground water samples using the following sampling protocol is recommended.

Collection of samples on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts (generally 2nd and 4th quarters).

For future sampling events, raw and filtered water sample pairs should be collected from select wells (identified below), to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory. Slow-purge methodology should be followed for all sampling events which include metals analyses. Refer to the Concentration Ranking and Monitoring Well Selection Protocol described below.

Concentration Ranking and Monitoring Well Selection Protocol

For the specified sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data from 4th Quarter 2008 through 3rd Quarter 2010, the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. Concentration Rankings and Recommended Well Sampling are summarized in Table 2 (attached).

Based on the specified protocol, monitoring wells 699MW01, 699MW02, 699MW04, 699MW05, 699MW06, 699MW08, 699MW15, 699RW03, 699RW05, 699RW11, and 616MW01 are recommended for sampling with laboratory analysis for antimony, arsenic, beryllium, cadmium, and lead, along with selenium and thallium as required.

Notes:

Results reported in µg/L.

Within the reporting period, the four highest concentrations are listed for each parameter.

Shaded rows indicate monitoring wells recommended for metals analysis.

Metals were analyzed during the following quarters: 1st, 2nd, & 3rd Quarters 2010.

*Based on results from the 4th Quarter 2010 and 1st Quarter 2011 sampling events, analysis of Selenium and Thallium may be required.

SITE SPECIFIC EVALUATION
BUILDING 750

Site data and 90th Percentile calculations are provided on Table 1 (attached), and summarized as follows:

90th Percentile Analysis Summary
Building 750

750	Sb	As	Ba	Be	Cd	Cr	Cu	Pb	Ni	Se*	Tl*
Jan 05 - Aug 10	n=29	n=62	n=111	n=58	n=41	n=77	n=67	n=18	n=77	n=86	n=2
90th Percentile	10.64	21.05	156.00	0.89	5.43	40.62	21.14	49.26	19.70	28.58	5.28
Mean	6.72	9.47	85.59	0.82	1.90	26.80	18.84	24.85	8.35	16.98	3.62
Adjusted Mean	5.61	5.73	58.65	0.46	1.07	9.90	6.00	9.76	4.36	9.85	1.54
NJDEP GWQS (ug/L)	**6**	**3**	**6000**	**1**	**4**	**70**	**1300**	**5**	**100**	**40**	**2**

Results reported in µg/L or parts per billion. Shaded cells indicate values that exceed the GWQS. "n" = population size in the statistical analysis. As a conservative measure, non-detectable results were not included in the statistical analysis, and thus the population size may be biased low when compared to the total number of data points. * Due to possible laboratory inaccuracies, the 90th Percentile Analysis was not used in developing sampling recommendations for these parameters.

90th Percentile Values Meet GWQS:

The 90th percentile values for barium, beryllium, chromium, copper, nickel, and selenium are below their respective GWQS.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Mean Values, or Adjusted Mean Values, Meet GWQS:

The mean value for cadmium is below its GWQS.

The adjusted mean values for antimony and thallium are below their respective GWQS.

Recommendations:

In consideration of the above, the following sampling protocol is recommended for this site:

1. Selenium and Thallium - Due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Evaluation of the 4th Quarter 2010 and 1st Quarter 2011 sampling should be performed to determine compliance with the GWQS. If exceedances of the GWQS are identified, the sampling protocol specified under item 3 below should be followed.

2. With the exception of selenium and thallium (addressed above), no further sampling/analysis is recommended for metals with 90th percentile values below their respective GWQS.

3. For remaining metals, the collection of ground water samples using the following sampling protocol is recommended.

Collection of samples on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts (generally 2nd and 4th quarters).

For future sampling events, raw and filtered water sample pairs should be collected from select wells (identified below), to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory. Slow-purge methodology should be followed for all sampling events which include metals analyses. Refer to the Concentration Ranking and Monitoring Well Selection Protocol described below.

Concentration Ranking and Monitoring Well Selection Protocol

For the specified sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data from 4th Quarter 2008 through 3rd Quarter 2010, the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. Concentration Rankings and Recommended Well Sampling are summarized in Table 2 (attached).

Based on the specified protocol, monitoring wells 750MW02, 750MW03, and 750MW04 are recommended for sampling with laboratory analysis for antimony, arsenic, cadmium, and lead, along with selenium and thallium as required.

Notes:

Results reported in µg/L.

Within the reporting period, the two highest concentrations are listed for each parameter.

Shaded rows indicate monitoring wells recommended for metals analysis.

Metals were analyzed during the entire reporting period, 4th Quarter 2008 through 3rd Quarter 2010.

*Based on results from the 4th Quarter 2010 and 1st Quarter 2011 sampling events, analysis of Selenium and Thallium may be required.

SITE SPECIFIC EVALUATION
BUILDING 812 (FTMM-64)

Site data and 90th Percentile calculations are provided on Table 1 (attached), and summarized as follows:

90th Percentile Analysis Summary
Building 812

812	Sb	As	Ba	Be	Cd	Cr	Cu	Pb	Ni	Se*	Tl*
May 10 - Aug 10	n=18	n=14	n=20	n=9	n=7	n=0	n=13	n=3	n=18	n=0	n=0
90th Percentile	11.88	4.85	185.30	1.57	29.82	NR	10.51	4.06	34.20	NR	NR
Mean	8.97	1.88	83.62	0.91	10.76	NR	4.61	3.37	14.24	NR	NR
Adjusted Mean	8.51	1.23	59.08	0.83	3.56	NR	2.99	2.95	9.92	NR	NR
NJDEP GWQS (ug/L)	**6**	**3**	**6000**	**1**	**4**	**70**	**1300**	**5**	**100**	**40**	**2**

Results reported in µg/L or parts per billion. Shaded cells indicate values that exceed the GWQS. "n" = population size in the statistical analysis. As a conservative measure, non-detectable results were not included in the statistical analysis, and thus the population size may be biased low when compared to the total number of data points. * Due to possible laboratory inaccuracies, the 90th Percentile Analysis was not used in developing sampling recommendations for these parameters.

90th Percentile Values Meet GWQS:

The 90th percentile values for barium, copper, lead, and nickel are below their respective GWQS.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Mean Values, or Adjusted Mean Values, Meet GWQS:

The mean values for arsenic and beryllium are below their respective GWQS.

The adjusted mean value for cadmium is below its GWQS.

Recommendations:

In consideration of the above, the following sampling protocol is recommended for this site:

1. Selenium and Thallium - Due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Evaluation of the 4th Quarter 2010 and 1st Quarter 2011 sampling should be performed to determine compliance with the GWQS. If exceedances of the GWQS are identified, the sampling protocol specified under item 3 below should be followed.

2. With the exception of selenium and thallium (addressed above), no further sampling/analysis is recommended for metals with 90th percentile values below their respective GWQS.

3. For remaining metals, the collection of ground water samples using the following sampling protocol is recommended.

Collection of samples on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts (generally 2nd and 4th quarters).

For future sampling events, raw and filtered water sample pairs should be collected from select wells (identified below), to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory. Slow-purge methodology should be followed for all sampling events which include metals analyses. Refer to the Concentration Ranking and Monitoring Well Selection Protocol described below.

Concentration Ranking and Monitoring Well Selection Protocol

For the specified sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data from 4th Quarter 2008 through 3rd Quarter 2010, the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. Concentration Rankings and Recommended Well Sampling are summarized in Table 2 (attached).

Based on the specified protocol, monitoring wells 812MW01, 812MW04, 812MW05, 812MW08, and, 812MW14 are recommended for sampling with laboratory analysis for antimony, arsenic, beryllium, and cadmium, along with selenium and thallium as required.

Adjusted Mean	8.01	3.27	26.24	0.11	1.16	5.00	7.37	4.02	4.86	NR	NR
NJDEP GWQS (ug/L)	**6**	**3**	**6000**	**1**	**4**	**70**	**1300**	**5**	**100**	**40**	**2**

Results reported in µg/L or parts per billion. Shaded cells indicate values that exceed the GWQS. "n" = population size in the statistical analysis. As a conservative measure, non-detectable results were not included in the statistical analysis, and thus the population size may be biased low when compared to the total number of data points. * Due to possible laboratory inaccuracies, the 90th Percentile Analysis was not used in developing sampling recommendations for these parameters.

90th Percentile Values Meet GWQS:

The 90th percentile values for barium, beryllium, cadmium, chromium, copper, and nickel are below their respective GWQS.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Mean Values, or Adjusted Mean Values, Meet GWQS:

The mean value for lead is below its GWQS.

Recommendations:

In consideration of the above, the following sampling protocol is recommended for this site:

1. Selenium and Thallium - Due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Evaluation of the 4th Quarter 2010 and 1st Quarter 2011 sampling should be performed to determine compliance with the GWQS. If exceedances of the GWQS are identified, the sampling protocol specified under item 3 below should be followed.

2. With the exception of selenium and thallium (addressed above), no further sampling/analysis is recommended for metals with 90th percentile values below their respective GWQS.

3. For remaining metals, the collection of ground water samples using the following sampling protocol is recommended.

Collection of samples on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts (generally 2nd and 4th quarters).

For future sampling events, raw and filtered water sample pairs should be collected from select wells (identified below), to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory. Slow-purge methodology should be followed for all sampling events which include metals analyses. Refer to the Concentration Ranking and Monitoring Well Selection Protocol described below.

Concentration Ranking and Monitoring Well Selection Protocol

For the specified sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data from 4th Quarter 2008 through 3rd Quarter 2010, the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. Concentration Rankings and Recommended Well Sampling are summarized in Table 2 (attached).

Based on the specified protocol, monitoring wells 886MW02, 886MW03, 886RW01, 886RW02, and 886RW06 are recommended for sampling with laboratory analysis for antimony, arsenic, and lead, along with selenium and thallium as required.

Notes:

Results reported in µg/L.

Within the reporting period, the two highest concentrations are listed for each parameter.

Shaded rows indicate monitoring wells recommended for metals analysis.

Metals were analyzed during the following quarters: 1st, 2nd, & 3rd Quarters 2010.

*Based on results from the 4th Quarter 2010 and 1st Quarter 2011 sampling events, analysis of Selenium and Thallium may be required.

SITE SPECIFIC EVALUATION
BUILDING 2567 (FTMM-58)

Site data and 90th Percentile calculations are provided on Table 1 (attached), and summarized as follows:

90th Percentile Analysis Summary
Building 2567

2567	Sb	As	Ba	Be	Cd	Cr	Cu	Pb	Ni	Se*	Tl*
March 10 - Sept 10	n=17	n=20	n=27	n=19	n=3	n=6	n=17	n=3	n=18	n=4	n=0
90th Percentile	14.5	2.6	975.0	0.5	1.5	9.4	12.7	10.9	11.5	1.9	NR
Mean	9.7	1.8	347.6	0.2	1.1	5.7	4.7	8.4	7.1	1.7	NR
Adjusted Mean	8.7	1.3	251.5	0.2	1.0	4.5	3.4	6.6	6.3	1.7	NR
NJDEP GWQS (ug/L)	**6**	**3**	**6000**	**1**	**4**	**70**	**1300**	**5**	**100**	**40**	**2**

Results reported in µg/L or parts per billion. Shaded cells indicate values that exceed the GWQS. "n" = population size in the statistical analysis. As a conservative measure, non-detectable results were not included in the statistical analysis, and thus the population size may be biased low when compared to the total number of data points. * Due to possible laboratory inaccuracies, the 90th Percentile Analysis was not used in developing sampling recommendations for these parameters.

90th Percentile Values Meet GWQS:

The 90th percentile values for arsenic, barium, beryllium, cadmium, chromium, copper, nickel, and selenium are below their respective GWQS.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Recommendations:

In consideration of the above, the following sampling protocol is recommended for this site:

1. Selenium and Thallium - Due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Evaluation of the 4th Quarter 2010 and 1st Quarter 2011 sampling should be performed to determine compliance with the GWQS. If exceedances of the GWQS are identified, the sampling protocol specified under item 3 below should be followed.

2. With the exception of selenium and thallium (addressed above), no further sampling/analysis is recommended for metals with 90th percentile values below their respective GWQS.

3. For remaining metals, the collection of ground water samples using the following sampling protocol is recommended.

Collection of samples on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts (generally 2nd and 4th quarters).

For future sampling events, raw and filtered water sample pairs should be collected from select wells (identified below), to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory. Slow-purge methodology should be followed for all sampling events which include metals analyses. Refer to the Concentration Ranking and Monitoring Well Selection Protocol described below.

Concentration Ranking and Monitoring Well Selection Protocol

For the specified sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data from 4th Quarter 2008 through 3rd Quarter 2010, the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. Concentration Rankings and Recommended Well Sampling are summarized in Table 2 (attached).

Based on the specified protocol, monitoring wells 2567MW01, 2567MW02, 2567MW03, and 2567MW05 are recommended for sampling with laboratory analysis for antimony and lead, along with selenium and thallium as required.

Table 1. Summary of Select Metal Concentrations in Groundwater from March 2010 to September 2010 at Site 2567

Notes:

Results reported in µg/L.

Within the reporting period, the two highest concentrations are listed for each parameter.

Shaded rows indicate monitoring wells recommended for metals analysis.

Lead was analyzed during the following quarters: 4th Quarter 2008 through 3rd Quarter 2010.

Antimony was analyzed during the following quarters: 1st quarter through 3rd Quarter 2010.

*Based on results from the 4th Quarter 2010 and 1st Quarter 2011 sampling events, analysis of Selenium and Thallium may be required.

SITE SPECIFIC EVALUATION
M-2 Landfill (FTMM-02)

Site data and 90th Percentile calculations are provided on Table 1 (attached), and summarized as follows:

90th Percentile Analysis Summary
M-2 Landfill

M-2	Sb	As	Ba	Be	Cd	Cr	Cu	Pb	Ni	Se*	Tl*
March 09 - Sept 10	n=62	n=58	n=65	n=1	n=20	n=8	n=14	n=29	n=16	n=19	n=2
90th Percentile	22.6	74.1	275.4	0.0	1.65	0.81	3.47	10.94	3.40	112.2	1.70
Mean	14.0	24.1	111.5	0.0	0.96	0.54	1.81	5.49	1.40	86.5	1.18
Adjusted Mean	12.39	17.85	86.34	0.05	0.82	0.43	1.45	4.60	0.85	82.96	0.53
NJDEP GWQS (ug/L)	**6**	**3**	**6000**	**1**	**4**	**70**	**1300**	**5**	**100**	**40**	**2**

Results reported in µg/L or parts per billion. Shaded cells indicate values that exceed the GWQS. "n" = population size in the statistical analysis. As a conservative measure, non-detectable results were not included in the statistical analysis, and thus the population size may be biased low when compared to the total number of data points. * Due to possible laboratory inaccuracies, the 90th Percentile Analysis was not used in developing sampling recommendations for these parameters.

90th Percentile Values Meet GWQS:

The 90th percentile values for barium, beryllium, cadmium, chromium, copper, nickel, and thallium are below their respective GWQS.

Note that due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Mean Values, or Adjusted Mean Values, Meet GWQS:

The adjusted mean value for lead is below its GWQS.

Recommendations:

In consideration of the above, the following sampling protocol is recommended for this site:

1. Selenium and Thallium - Due to possible laboratory inaccuracies affecting selenium and/or thallium results, the 90th Percentile Analysis was not used to determine compliance with the GWQS.

Evaluation of the 4th Quarter 2010 and 1st Quarter 2011 sampling should be performed to determine compliance with the GWQS. If exceedances of the GWQS are identified, the sampling protocol specified under item 3 below should be followed.

2. With the exception of selenium and thallium (addressed above), no further sampling/analysis is recommended for metals with 90th percentile values below their respective GWQS.

3. For remaining metals, the collection of ground water samples using the following sampling protocol is recommended.

Collection of samples on a semiannual basis, targeting the times of the year typically exhibiting elevated precipitation amounts (generally 2nd and 4th quarters).

For future sampling events, raw and filtered water sample pairs should be collected from select wells (identified below), to evaluate the input from sample turbidity. Samples should be analyzed by a NJ certified laboratory. Slow-purge methodology should be followed for all sampling events which include metals analyses. Refer to the Concentration Ranking and Monitoring Well Selection Protocol described below.

Concentration Ranking and Monitoring Well Selection Protocol

For the specified sampling events, the monitoring wells recommended for sampling were selected with a bias towards those wells demonstrating the highest concentrations as follows.

For the available data from 4th Quarter 2008 through 3rd Quarter 2010, the highest observed concentrations for the site monitoring wells were ranked for each metal of concern. For larger sites, such as landfills, the highest four concentrations were listed; for smaller sites, the highest two concentrations were deemed adequate. Concentration Rankings and Recommended Well Sampling are summarized in Table 2 (attached).

Based on the specified protocol, monitoring wells M2MW03, M2MW06, M2MW07, M2MW09, M2MW11, M2MW21, M2MW23, and M2MW24 are recommended for sampling with laboratory analysis for antimony, arsenic, and lead, along with selenium and thallium as required.
