

## PROPOSED PLAN FOR SITES FTMM-28, FTMM-54, FTMM-55, FTMM-56, FTMM-61, AND FTMM-64

Fort Monmouth, Oceanport, Monmouth County, New Jersey

July 2020

### INTRODUCTION

1 The U.S. Army is presenting this **Proposed Plan\***  
2 for the public to review and comment regarding  
3 **no further action (NFA)** proposed for six sites at  
4 Fort Monmouth (FTMM) in Monmouth County,  
5 New Jersey: FTMM-28, FTMM-54 FTMM-55,  
6 FTMM-56, FTMM-61, and FTMM-64. The U.S.  
7 Army (Army) is the lead agency for FTMM in  
8 accordance with the **Defense Environmental**  
9 **Restoration Program (DERP)** (10 U.S.C. §2701  
10 et. seq.). New Jersey Department of  
11 Environmental Protection (NJDEP) is the state  
12 regulatory agency which administers the State's  
13 Site Remediation Program under the Technical  
14 Requirements for Site Remediation (**New Jersey**  
15 **Administrative Code (N.J.A.C.)** 7:26E). NJDEP,  
16 in consultation with the Army, will make the final  
17 selection of the response action for sites FTMM-  
18 28, FTMM-54 (south of FTMM-18), FTMM-55,  
19 FTMM-56, FTMM-61, and FTMM-64 after  
20 consideration of public input.

21 These sites are classified as **Petroleum, Oil, and**  
22 **Lubricant (POL)** Sites and therefore are exempt  
23 from the **Comprehensive Environmental**  
24 **Response, Compensation and Liability Act** of  
25 1980 (**CERCLA**, 42 U.S.C. §§9601(14) and  
26 9604(a)(2)) process. However, the Army's  
27 authority to investigate and remediate  
28 environmental contamination, as described in the  
29 DERP Manual (DoDM 4715.20, 9 March 2012),  
30 requires all such investigations and remedy  
31 selection processes be consistent with CERCLA.  
32 For POL sites, and other Resource Conservation  
33 and Recovery Act (RCRA) corrective action  
34 responses, the Department of Defense (DoD)  
35 interprets "consistent with" to mean public  
36 participation prior to remedy selection, as  
37 described in the **National Oil and Hazardous**  
38 **Substances Pollution Contingency Plan** (NCP  
39 40 CFR Part 300). The Army presents this  
40 Proposed Plan, consistent with 40 CFR  
41 300.430(f)(2), to present to the public the remedy

\* Words or phrases shown in **BOLD** are defined in the glossary  
at the end of this document.

#### Dates to Remember: PLEASE MARK YOUR CALENDAR

##### PUBLIC COMMENT PERIOD:

**August 10, 2020 – September 10, 2020**

The Army will accept written comments on the  
Proposed Plan during the public comment pe-  
riod. Written comments may be postmarked or  
emailed by **September 10, 2020** and sent to:

BRAC Environmental Coordinator  
U.S. Army Fort Monmouth  
Attn: Mr. William Colvin  
P.O. Box 148  
Oceanport, NJ 08641  
or  
[william.r.colvin18.civ@mail.mil](mailto:william.r.colvin18.civ@mail.mil)

The Proposed Plan can be viewed at  
[www.fortmonmouthrecords.com](http://www.fortmonmouthrecords.com) or (subject to  
COVID-19 restrictions) at the Fort Monmouth  
Environmental Restoration Public Information  
Repository (the Administrative Record) at the  
following location:

Monmouth County Library, Eastern Branch  
1001 Route 35, Shrewsbury, NJ 07702  
Phone: (732) 683-8980

43 selected by the NJDEP.  
44

45 FTMM-28 was also a pesticide storage site.  
46 However, the results of an environmental  
47 investigation indicated that pesticides were not  
48 **contaminants of concern (COCs)** under  
49 CERCLA and did not require additional action.  
50 CERCLA risk assessments were not performed  
51 for these sites, and NJDEP soil cleanup  
52 standards and **Ground Water Quality**  
53 **Standards (GWQS)** were used to evaluate the  
54 need for remediation of these six sites. The  
55 evaluation of these sites was based on previous  
56 environmental investigations which concluded  
57 that NFA is required based on NJDEP criteria and  
58 NJDEP has agreed.

59 A portion of FTMM-54 overlaps with FTMM-18,  
60 FTMM-18 is not included in this Proposed Plan.

1 The only FTMM-54 soil with COCs was located  
2 within the FTMM-18 site boundary, and will be  
3 addressed by the engineering and institutional  
4 controls implemented for the FTMM-18 landfill.  
5 Therefore, the portion of FTMM-54 included in  
6 this Proposed Plan is the portion south of the  
7 FTMM-18 boundary.

8 This Proposed Plan provides the rationale for the  
9 NFA determination and describes the public  
10 involvement process for sites FTMM-28, FTMM-  
11 54 (south of FTMM-18), FTMM-55, FTMM-56,  
12 FTMM-61, and FTMM-64.

## 13 PUBLIC INVOLVEMENT 14 PROCESS

15 As the lead agency for implementing the  
16 environmental response program at FTMM, the  
17 Army has prepared this Proposed Plan in  
18 accordance with CERCLA Section 117(a) and  
19 Section 300.430(f)(2) of the NCP to continue its  
20 community awareness efforts and to encourage  
21 public participation. This Proposed Plan is also  
22 consistent with the public outreach requirements  
23 of the N.J.A.C. 7:26C-1.7. After the public has the  
24 opportunity to review and comment on this  
25 Proposed Plan, the Army will respond to the  
26 comments received during the public comment  
27 period. Information on the public comment period  
28 is presented in the box on Page 1.

29 Local community members and other interested  
30 parties are encouraged to review this Proposed  
31 Plan and submit comments. The Army will  
32 carefully consider all comments received from the  
33 public and provide responses which will be  
34 compiled into a **Responsiveness Summary**.  
35 The decision on the appropriate action for sites  
36 FTMM-28, FTMM-54 (south of FTMM-18),  
37 FTMM-55, FTMM-56, FTMM-61, and FTMM-64  
38 will be detailed in a **Record of Decision (ROD)**,  
39 which will include the Responsiveness Summary.

40 This Proposed Plan summarizes information that  
41 can be found in greater detail in the Underground  
42 Storage Tank (UST) Closure Reports, **Site**  
43 **Investigations (SIs)**, **Remedial Investigations**  
44 **(RIs)**, and other documents contained in the  
45 **Administrative Record** file for FTMM and on the  
46 website listed in the box on Page 1. The Army  
47 encourages the public to review these documents  
48 to gain a more comprehensive understanding of  
49 the sites and all associated activities.

87

## 50 SITE BACKGROUND

51 FTMM is located in the central-eastern portion of  
52 New Jersey in Monmouth County, approximately  
53 45 miles south of New York City, New York; 70  
54 miles northeast of Philadelphia, Pennsylvania;  
55 and 40 miles east of Trenton, New Jersey. The  
56 Atlantic Ocean is approximately 3 miles to the  
57 east. FTMM was comprised of three areas: the  
58 Main Post (MP), the Charles Wood Area (CWA),  
59 (Figure 1), and the Evans Area (EA) (not shown).  
60 FTMM's MP and CWA were selected for closure  
61 by the Base Realignment and Closure (BRAC)  
62 Commission in 2005, and officially closed on  
63 September 15, 2011. The EA was closed under  
64 BRAC in 1998 and has since been transferred  
65 from FTMM.

66

67

**Figure 1: Fort Monmouth Location**

68 Numerous investigations were conducted at  
69 sites FTMM-28, FTMM-54, FTMM-55, FTMM-  
70 56, FTMM-61, and FTMM-64 over the past 35  
71 years. The locations of five sites on the MP are  
72 shown on Figure 2, and FTMM-28 on the CWA  
73 is shown on Figure 3. Generally these  
74 investigations are summarized in the most recent  
75 RI or other summary report for each site.

## 76 SITE CHARACTERIZATION

77 Major vegetation zones at FTMM consist of  
78 landscaped areas, wetlands, **riparian** areas,  
79 upland forests, and **old field habitats**. Much of  
80 the upland areas of the MP and CWA consist of  
81 extensive areas of regularly mowed lawns and  
82 landscaped areas. Detailed vegetation  
83 information can be found in the Baseline  
84 Ecological Evaluation Report (Shaw, 2012).

85 FTMM is situated on Coastal Plain deposits which  
86 are unconsolidated material that has not been

Figure 2 - Main Post Locations

Figure 3 - Charles Wood Area Location

1 cemented or compacted. Soil encountered at  
2 FTMM is typically comprised of fine to coarse  
3 sand with fine gravel, and green/gray/black  
4 sandy silt and clay with varying amounts of sand  
5 and gravel.

6 **Groundwater** is typically encountered at the MP  
7 and in the surrounding areas at depths of 2 to 9  
8 feet below ground surface (bgs), and at depths  
9 of approximately 7 to 14 feet bgs at the CWA.  
10 Groundwater elevations fluctuate in response to  
11 precipitation events, with some tidal influence in  
12 areas near creeks (such as FTMM-54 and  
13 FTMM-56). New Jersey GWQS classify  
14 groundwater at FTMM as Class II-A: **potable**  
15 **water** with secondary uses including agricultural  
16 and industrial (NJDEP, 2010).

17 A Baseline Ecological Evaluation was performed  
18 and many of the sites were determined not to  
19 have environmentally sensitive natural  
20 resources (Shaw, 2012). However, some of the  
21 sites were determined to require additional  
22 evaluation through the Baseline Ecological  
23 Evaluation process based on the potential for  
24 contamination migration and impacts to  
25 **ecological receptors**. Of the six sites in this  
26 Proposed Plan, only FTMM-28 and FTMM-61  
27 were determined to have the potential for  
28 impacts to ecological receptors. They were both  
29 evaluated further in the Baseline Ecological  
30 Evaluation and it was concluded that potential  
31 ecological effects were negligible. Therefore,  
32 additional ecological assessments at FTMM-28  
33 and FTMM-61 were not warranted or  
34 recommended.

35 There is no surface water or sediment within  
36 sites FTMM-28, FTMM-54, FTMM-55, FTMM-  
37 56, FTMM-61, and FTMM-64. Additionally,  
38 nearby surface water and sediment that were  
39 outside but near FTMM-28 and FTMM-61 were  
40 evaluated in the Baseline Ecological Evaluation  
41 and it was determined that no further action was  
42 appropriate for surface water and sediment.  
43 Therefore, no further action for surface water or  
44 sediment is required for any of the six sites.

45 To determine the nature and extent of  
46 contamination at each site, detected  
47 concentrations of potential contaminants were  
48 compared to State (NJDEP) residential, non-  
49 residential, and **Impact to Groundwater (IGW)**  
50 screening criteria as well as FTMM-specific  
51 background concentrations for metals (Weston,  
52 1995). NJDEP comparison criteria included:

53 • Residential Direct Contact Soil Remediation  
54 Standards (RDCSRS), Non-Residential  
55 Direct Contact Soil Remediation Standards  
56 (NRDCSRS), and IGW screening levels  
57 (SLs) for soils; and

58 • GWQS for groundwater.

59 The above criteria were used to identify those  
60 chemicals that are COCs. As described below,  
61 any contaminants that were once identified as  
62 COCs for sites FTMM-28, FTMM-54, FTMM-55,  
63 FTMM-56, FTMM-61, and FTMM-64 have been  
64 further evaluated and/or remediated and  
65 determined to no longer be COCs, and NJDEP  
66 has agreed.

67 The following subsections describe site  
68 characterization activities for soil and  
69 groundwater for each of the six sites covered by  
70 this Proposed Plan.

#### 71 **FTMM-28**

72 FTMM-28 is in the south-central portion of the  
73 CWA in the vicinity of former Building T-2044  
74 and has an area of approximately 0.6 acre. The  
75 site is located in the southwest section of the  
76 CWA golf course (Figures 3 and 4).

77 **Figure 4 – FTMM-28 Site Boundary and Layout**

78 FTMM-28, also known as CW-6, included former  
79 Building T-2044 that was historically used to  
80 store and mix pesticides and herbicides. Nearby  
81 Buildings T-2070 and T-2071 were used to store  
82 golf course maintenance and landscaping  
83 equipment such as tractors and mowers.  
84 Storage or mixing of pesticides or herbicides  
85 was discontinued at FTMM-28 prior to 1995. The  
86 anticipated future land use at FTMM-28 is open  
87 space with the surrounding area anticipated to  
88 remain a golf course. Previous investigations at  
89 FTMM-28 included an SI (Weston, 1995), UST  
90 Closure and SI Report (ATC, 2000a), a UST

1 Report Addendum (U.S. Army, 2002), an RI  
2 (Versar, 2005b), and an RI Report Addendum  
3 (Tetra Tech, 2010) as summarized below.

#### 4 USTs

5 Three USTs (one for fuel oil, one diesel, and one  
6 gasoline) were removed in December 1993. The  
7 Army submitted a UST Closure and SI Report  
8 (ATC, 2000a) that included the results of UST-  
9 related soil sampling (described below). NJDEP  
10 (2003) agreed that all three USTs had been  
11 properly closed and that NFA was warranted.

#### 12 Soils

13 In early 1994 post-excavation soil samples were  
14 collected at FTMM-28 to support closure of the  
15 USTs. The soil samples were analyzed for **total**  
16 **petroleum hydrocarbons (TPH)**, **volatile**  
17 **organic compounds (VOCs)**, and/or lead. No  
18 exceedances of applicable NJDEP comparison  
19 criteria were found in the soil samples.

20 Soil samples were collected from two borings  
21 near the pesticide storage area as part of the SI  
22 (Weston, 1995) and analyzed for VOCs,  
23 **semivolatile organic compounds (SVOCs)**,  
24 pesticides, **polychlorinated biphenyls (PCBs)**,  
25 and **target analyte list (TAL) metals**. Detected  
26 analytes in soil were less than the applicable  
27 NJDEP comparison criteria and no COCs were  
28 identified in soils. NJDEP (1996) agreed with the  
29 SI recommendations, which included additional  
30 long-term groundwater monitoring (discussed  
31 below), but no additional measures for soils.

32 Additional soil samples were collected from the  
33 former UST area in August 2010 and analyzed  
34 for VOCs plus 10 **tentatively identified**  
35 **compounds (TICs)** and lead, which had not  
36 been consistently sampled during post-  
37 excavation sampling in 1994. Based on the  
38 results of this and previous sampling, NJDEP  
39 (2012) determined that unrestricted use and  
40 NFA was appropriate for FTMM-28.

#### 41 Groundwater

42 Three monitoring wells were installed in 1994.  
43 Benzene, methylene chloride, arsenic, and lead  
44 were detected in the groundwater at levels  
45 greater than their applicable NJDEP comparison  
46 criteria.

47 A fourth monitoring well was installed in 1995,  
48 and groundwater samples were collected and  
49 analyzed for VOCs, SVOCs, pesticides, and  
50 PCBs. Benzene was the only analyte detected

51 at concentrations greater than the NJDEP  
52 GWQS and the Army implemented a long-term  
53 monitoring program (Weston, 1995).

54 An RI Report was prepared in 2005 that  
55 presented the results of the first 18 rounds of  
56 quarterly groundwater sampling at FTMM-28.  
57 These samples were analyzed for VOCs,  
58 SVOCs, pesticides, PCBs, and TAL metals. Two  
59 additional rounds of low-flow sampling were also  
60 conducted for TAL metals analysis. No COCs  
61 were identified in the 2005 RI.

62 An RI Report Addendum was prepared in 2010  
63 that presented the results of 38 additional  
64 rounds of quarterly groundwater sampling  
65 collected from May 2001 through July 2010.  
66 Again, no COCs were identified in the  
67 groundwater at FTMM-28. Based on the results  
68 of this and previous sampling, NJDEP (2012)  
69 determined that unrestricted use and NFA was  
70 appropriate for FTMM-28.

#### 71 FTMM-54 (south of FTMM-18)

72 FTMM-54, a former gasoline and diesel fuel  
73 distribution facility, is located in the central  
74 portion of the MP, north of Sherrill Avenue and  
75 south of Parkers Creek (Figures 2 and 5).

76 **Figure 5 – FTMM-54 Site Boundary and Layout**

77 FTMM-54 is associated with nearby Building  
78 296, and has also been referred to historically as  
79 Building 296 or Site 296. Building 296 is near  
80 existing Buildings 145, 283, 288, 291, 292, 293,  
81 and 295, referred to collectively as the “Squier  
82 Hall Complex.” The anticipated future land use  
83 at FTMM-54 is offices and research and  
84 development (R&D). Previous investigations at  
85 FTMM-54 included UST Closure and Site  
86 Investigation Reports (Smith, 1996; Versar,  
87 2001a), a Summary RI Report (U.S. Army,  
88 2015), and additional delineation sampling as  
89 summarized below.

## 1 USTs

2 Twelve UST closures have been completed at  
3 FTMM-54. In 1993 nine gasoline and two diesel  
4 USTs were discovered in one area south of  
5 Building 296 and removed. Excavation of  
6 stained soil was conducted during removal of the  
7 USTs and the area was backfilled and graded.  
8 In addition, excavation of associated fuel  
9 distribution piping was completed between  
10 November 1993 and January 1994; this piping  
11 extended about 0.5 mile from the UST area north  
12 to the FTMM-18 landfill. The Army submitted a  
13 UST Closure and SI Report to NJDEP (Versar,  
14 2001a) that included the results of UST and  
15 piping-related soil sampling (described below).  
16 NJDEP (2003) agreed that all 11 USTs and  
17 associated piping had been properly closed and  
18 that no further action was warranted.

19 One fuel oil UST associated with Building 296  
20 was also removed in 1993. NJDEP (2016a)  
21 agreed that this UST was properly closed and  
22 that no further action was warranted.

## 23 Soils

24 Between November 1993 and January 1994,  
25 post-excavation soil samples were collected  
26 from locations along the base of the excavation  
27 where the USTs and associated piping were  
28 removed. These samples were analyzed for  
29 VOCs, TPH, and lead, and any detections were  
30 less than the applicable NJDEP cleanup criteria.  
31 These soil sample results provided the basis for  
32 the NFA determinations discussed above for the  
33 nine gasoline, two diesel, and one fuel oil USTs  
34 at FTMM-54.

35 The Army (2015) recommended no further  
36 action for soil for the portion of FTMM-54 located  
37 south of the FTMM-18 site boundary and NJDEP  
38 (2016a) agreed with this recommendation.

39 Additional soil samples were collected in 2016  
40 and 2017 to delineate naphthalene detections in  
41 the portion of FTMM-54 north of the FTMM-18  
42 site boundary. The soil was adequately  
43 delineated (U.S. Army, 2017d). The only FTMM-  
44 54 soil with COCs was located within the FTMM-  
45 18 site boundary, and will be addressed by the  
46 engineering and institutional controls  
47 implemented for the FTMM-18 landfill.

## 48 Groundwater

49 Quarterly groundwater monitoring occurred at  
50 FTMM-54 from June 1994 to August 2011 using

51 a network of up to seven monitoring wells. The  
52 Army (2014) recommended no further action for  
53 FTMM-54 groundwater, excluding benzene in  
54 well 296MW06 which exceeded the NJDEP  
55 GWQS for benzene and is located within the  
56 FTMM-18 landfill, and so will be addressed  
57 within the FTMM-18 landfill remedy. NJDEP  
58 (2015a) agreed with this recommendation.

## 59 FTMM-55

60 FTMM-55 is located in the north-central portion  
61 of the MP, north of Sherrill Avenue and south of  
62 Parkers Creek. FTMM-55 is associated with  
63 former Building 290 (Figures 2 and 6), which was  
64 near existing Buildings 145, 283, 288, 291, 292,  
65 293, 295 and 296, referred to collectively as the  
66 "Squier Hall Complex." The anticipated future  
67 land use is offices and R&D. FTMM-55 is  
68 immediately south of the FTMM-18 landfill (not  
69 included in this Proposed Plan). FTMM-55 is  
70 unoccupied and consists of landscaped  
71 vegetation and lawn area.

72 **Figure 6 – FTMM-55 Site Boundary and Layout**

73 FTMM-55 (Building 290) was a former military  
74 vehicle repair and maintenance facility that  
75 included four USTs and a gasoline dispenser  
76 island. The site formerly served as a military  
77 motor pool. Building 290 was demolished in  
78 2000. Three UST Closure and Site Investigation  
79 Reports (each for a different UST) were  
80 prepared in 1993, 2000, and 2001 (Weston,  
81 1993; ATC, 2000b; Versar, 2001b). An SI/RI  
82 Report was prepared in 1999 (SMC, 1999).  
83 Previous investigations were summarized in a  
84 Final Summary RI Addendum Report submitted  
85 to NJDEP (U.S. Army, 2016).

## 86 USTs

87 Four UST closures have been completed at  
88 FTMM-55: one waste oil UST, one diesel UST,  
89 and two gasoline USTs associated with Building

1 290. These four USTs and a gasoline dispenser  
2 island were removed between 1991 and 1994  
3 and the excavations have been backfilled and  
4 graded. Soil and groundwater investigations  
5 were performed, and NJDEP (2000b, 2003,  
6 2015b) agreed that all four USTs were properly  
7 closed and that NFA was warranted.

#### 8 Soil

9 Soil samples were collected from 1991 to 1994  
10 as part of the UST investigations and analyzed  
11 for TPH (with some samples analyzed for lead,  
12 VOCs, priority pollutants, and TICs). Soil  
13 samples were also collected in 2016 in the area  
14 of the diesel UST and sampled for **extractable**  
15 **petroleum hydrocarbons (EPH)**. Based on  
16 these sample results, soil concentrations at this  
17 UST were less than the applicable NJDEP  
18 comparison criterion, and NJDEP (2016c)  
19 agreed with the Army's recommendation of NFA.

#### 20 Groundwater

21 Two groundwater wells were initially installed at  
22 FTMM-55 in 1994 after the removal of the four  
23 USTs. Initially the wells were sampled quarterly  
24 for VOCs, SVOCs, pesticides, PCBs, and  
25 metals. Starting in 2005 only VOCs and metals  
26 were sampled because SVOCs, pesticides, and  
27 PCBs were determined not to be COCs based  
28 on the 1997 through 2004 sampling results.  
29 Exceedances of applicable NJDEP GWQS for  
30 lead and arsenic in groundwater were attributed  
31 to background concentrations. VOCs were not  
32 detected in the last four rounds of sampling from  
33 November 2010 to August 2011. NJDEP  
34 (2016c) agreed with the Army's  
35 recommendation to discontinue groundwater  
36 sampling after August 2013 and with the  
37 recommendation of NFA for groundwater.

#### 38 **FTMM-56**

39 FTMM-56 is in the eastern portion of the MP  
40 approximately 500 feet northwest of Oceanport  
41 Creek. The site is located north of Riverside  
42 Avenue and south of Building 166, and was also  
43 known as Site 80/166 because of the  
44 association with the former fuel oil USTs for  
45 Building T-80 (which has been demolished) and  
46 existing Building 166 (Figures 2 and 7).

47 FTMM-56 is comprised of the former fuel oil  
48 tanks UST 166 and UST 80, and the associated  
49 groundwater monitoring wells. Prior to 2018 the  
50 site was used as a maintenance yard for FTMM.  
51 The anticipated future land use at FTMM-56 is

52 open space. Previous investigations at FTMM-  
53 56 are summarized below, and include UST  
54 Closure and SI Reports (ATC, 1998 and 2000c),  
55 an RI report prepared for Site 80/166 (Versar,  
56 2005a) and a Summary RI Addendum Report  
57 (U.S. Army, 2017a).

58 **Figure 7 – FTMM-56 Site Boundary and Layout**

#### 59 USTs

60 The two FTMM-56 fuel oil USTs were removed  
61 in 1994 during an FTMM program to upgrade  
62 heating oil tanks with natural gas. Stained soils  
63 were observed, and potentially contaminated  
64 soil was removed from both UST excavation  
65 locations. Confirmation soil samples were  
66 collected at both UST excavations during tank  
67 closure. The Army submitted two UST closure  
68 reports, and NJDEP (2000a) agreed with the  
69 Army's recommendation of NFA.

#### 70 Soils

71 Post-excavation soil samples were collected in  
72 1994 after the tanks and associated piping were  
73 removed. The samples were analyzed for TPH,  
74 which was not detected at concentrations  
75 greater than applicable NJDEP cleanup criteria.  
76 Additional soil samples were collected as  
77 reported in the 2005 RI and analyzed for VOCs  
78 and 15 TICs; detections were less than  
79 applicable NJDEP cleanup criteria. NFA for  
80 FTMM-56 soils was approved by NJDEP (2008)  
81 based on the 2005 RI Report, and NFA for the  
82 entire FTMM-56 site was determined to be  
83 warranted by NJDEP (2017b) based on the  
84 findings of the Summary RI (U.S. Army, 2017a).

#### 85 Groundwater

86 Following removal of the fuel oil tanks, two  
87 groundwater monitoring wells were installed and  
88 two rounds of sampling for VOCs and SVOCs  
89 were performed in 1995. One well did not have  
90 any detections exceeding the NJDEP GWQS.

1 Benzene was the only analyte detected in well  
2 80MW01 at concentrations exceeding the  
3 NJDEP GWQS. In July 2000 four additional  
4 groundwater monitoring wells were installed and  
5 analyzed for VOCs, SVOCs, pesticides, PCBs,  
6 and TAL metals (Versar, 2005a).

7 The analytical results for the groundwater  
8 samples collected between April 1997 and  
9 January 2001 indicated that a-chlordane, g-  
10 chlordane, arsenic and lead exceeded the  
11 NJDEP GWQS at Site 80/166 and were  
12 considered COCs (benzene was detected at  
13 concentrations less than the NJDEP GWQS and  
14 so was no longer a COC). From November 2004  
15 to August 2011, the six wells were sampled  
16 quarterly for pesticides and metals only, as  
17 agreed to by NJDEP (2004).

18 Samples collected from March 2011 through  
19 2015 were used in the Summary RI Addendum  
20 Report (U.S. Army, 2017a) which demonstrated  
21 that lead, cadmium, and pesticide  
22 concentrations were less than their respective  
23 NJDEP GWQS. Although arsenic (at 3.7  
24 micrograms per liter [ $\mu\text{g/L}$ ]) was detected at a  
25 concentration slightly greater than the NJDEP  
26 GWQS of 3  $\mu\text{g/L}$  at 80MW05, it was attributed to  
27 naturally occurring background conditions  
28 related to glauconitic soils present at FTMM, and  
29 not related to the former fuel oil USTs. NJDEP  
30 (2017b) agreed with the findings of the Summary  
31 RI Addendum and that NFA was warranted for  
32 FTMM-57.

### 33 **FTMM-61**

34 FTMM-61 is located on the northern side of the  
35 central portion of the MP at FTMM at the  
36 intersection of Sherrill Avenue and Brewers  
37 Avenue, and approximately 200 feet south of  
38 Parkers Creek (Figures 2 and 8).

39 **Figure 8 – FTMM-61 Site Boundary and Layout**

40 FTMM-61 is associated with Building 283 Squier  
41 Hall, and has also been referred to historically as  
42 Site 283. Building 283 is near existing Buildings  
43 145, 288, 291, 292, 293, 295 and 296, referred  
44 to collectively as the “Squier Hall Complex.” The  
45 anticipated future land use is offices and R&D.  
46 Building 283 functioned as the Squier  
47 Laboratory from 1934 to 1954 and then as  
48 administrative offices until FTMM closure in  
49 2011. Previous investigations at FTMM-61  
50 included UST Closure and Site Investigation  
51 reports (SMC, 1998; Versar, 2000), an  
52 **RI/Remedial Action Workplan (RAWP)**  
53 (Versar, 2005c), and a Summary RI Report (U.S.  
54 Army, 2017c) as summarized below.

### 55 **USTs**

56 A total of three USTs were removed from FTMM-  
57 61, including two fuel oil USTs (UST 283A and  
58 283B) and one gasoline UST from the Building  
59 283 courtyard area (UST 283C). There were no  
60 indications of releases from the two fuel oil  
61 USTs, which received approval for NFA from the  
62 NJDEP in February 2000 (NJDEP, 2000a) and  
63 May 2017 (NJDEP, 2017c).

64 A release from the gasoline UST 283C was  
65 initially reported in 1997 following removal of the  
66 tank. Stained soils were observed and  
67 approximately 400 cubic yards of potentially  
68 contaminated soil were removed from the UST  
69 excavation, followed by collection of  
70 confirmation soil samples. The Army submitted  
71 a UST closure report in 2000, and NJDEP (2003)  
72 agreed with the Army’s recommendation of NFA.  
73 Groundwater contamination was addressed  
74 further through installation of monitoring wells,  
75 implementation of the 2005 RI/RAWP, and  
76 several rounds of **Oxygen Release Compound**  
77 **(ORC) Advanced™** injections as described  
78 further below.

### 79 **Soil**

80 Post-excavation soil samples were collected in  
81 1997 from the UST 283B excavation and from  
82 below piping associated with the UST. TPH was  
83 detected at concentrations less than the  
84 applicable NJDEP cleanup criteria.

85 Post-excavation samples collected in 1997 from  
86 the initial UST 283C excavation were analyzed  
87 for TPH, lead, and VOCs, which indicated  
88 petroleum contamination was remaining in site  
89 soils. Approximately 400 cubic yards of  
90 additional soil was removed, and analysis of the

1 final post-excavation samples indicated that all  
2 soil constituents were less than the applicable  
3 NJDEP cleanup criteria.

4 UST 283A was removed in 1990. Soil samples  
5 were collected in August 2016 and analyzed for  
6 EPH. EPH was not detected at concentrations  
7 greater than the applicable NJDEP cleanup  
8 criteria and NJDEP (2017c) agreed with the  
9 recommendation of NFA for soil.

10 Additionally, the potential for **vapor intrusion**  
11 **(VI)** at Building 283 was investigated and the  
12 NJDEP (2013) agreed that no further VI action  
13 was needed for Building 283.

#### 14 Groundwater

15 Groundwater at FTMM-61 was evaluated  
16 through quarterly groundwater monitoring from  
17 September 1999 through February 2004, as  
18 reported in the 2005 RI/RAWP. The RI/RAWP  
19 identified benzene, ethylbenzene, total xylenes,  
20 and lead as COCs at Site 283 (FTMM-61), and  
21 recommended continued groundwater  
22 monitoring and sampling, the installation of  
23 additional monitoring wells, and an ORC  
24 Advanced™ injection program to reduce the  
25 concentrations of VOCs in groundwater. The  
26 injection program was implemented from 2009  
27 to 2011.

28 Subsequent groundwater monitoring occurred at  
29 FTMM-61 in August 2013 (VOCs and lead) and  
30 October 2014 (VOCs only). Benzene and lead  
31 concentrations decreased to non-detectable  
32 levels and the Army recommended the  
33 discontinuation of groundwater sampling at  
34 FTMM-61. NJDEP (2016b) subsequently  
35 concurred with this recommendation and  
36 agreed that NFA for FTMM-61 groundwater was  
37 warranted (NJDEP, 2017c).

#### 38 FTMM-64

39 FTMM-64, also known as Building 812 or Site  
40 812, is approximately 2.75 acres and is located  
41 in the south-central portion of the Main Post. The  
42 site is bordered to the southeast by Stephenson  
43 Avenue, and to the north and west by Lane  
44 Avenue (Figures 2 and 9).

45 Building 812 formerly served as the Army  
46 Community Center and was also a reported  
47 location of a former gas station. The anticipated  
48 future land use at FTMM-64 is low density  
49 residential. Previous investigations at FTMM-64  
50 include an RI/RAWP (Versar, 2001c), a pipeline

51 excavation in 2010, and a Supplement to the RI  
52 Report (U.S. Army, 2018) as summarized below.

53 **Figure 9 – FTMM-64 Site Boundary and Layout**

#### 54 Soil

55 An extensive soil investigation was conducted at  
56 FTMM-64 in 1999 and 2000 as part of the  
57 RI/RAWP. Soil samples were collected and  
58 analyzed for VOCs, SVOCs, pesticides, PCBs,  
59 TPH, and TAL metals, as discussed further  
60 below.

61 In 2010, the Army excavated an old pipeline that  
62 was historically used to convey fuel to  
63 dispensers located at FTMM-64. The entire  
64 pipeline except the portion directly beneath  
65 Building 812 was removed. Soil samples were  
66 collected along the pipeline excavation and  
67 analyzed for VOCs, TPH, and lead. Naphthalene  
68 was detected at concentrations greater than the  
69 applicable NJDEP cleanup criteria at two  
70 locations. Both locations were excavated further  
71 and post-excavation samples were collected. All  
72 post-excavation sample results were less than  
73 the applicable NJDEP cleanup criteria,  
74 indicating that soil contamination was removed.  
75 The excavations were backfilled with sand and  
76 stone.

77 Of the 1999 and 2000 soil samples, one sample  
78 result for lead and one sample result for TPH  
79 exceeded the applicable NJDEP cleanup  
80 criteria. Therefore, all the soil sample results  
81 associated with FTMM-64 were re-evaluated in  
82 February 2018. **Compliance averaging** was  
83 applied to determine whether the current  
84 residential remedial goals for lead and EPH  
85 (which is comparable to TPH) had been  
86 achieved at FTMM-64. Consistent with NJDEP  
87 guidance on compliance averaging, **functional**  
88 **areas** were created. The average lead and TPH  
89 concentrations for each functional area were  
90 less than the applicable NJDEP cleanup criteria.

1 Therefore, the Army recommended NFA for soils  
2 at FTMM-64 and NJDEP (2018) agreed.

### 3 Groundwater

4 To evaluate groundwater conditions at FTMM-  
5 64, 14 groundwater monitoring wells were  
6 installed during April and May 2000. The 2001  
7 RI/RAWP identified VOCs as COCs in  
8 groundwater and proposed implementation of a  
9 **Hydrogen Release Compound (HRC®)**  
10 injection program to address the groundwater  
11 contamination. The initial injections of HRC were  
12 performed between June and August 2001. The  
13 injections successfully reduced the  
14 concentrations of tetrachloroethene (PCE) and  
15 other VOCs over the first 12 months following  
16 the initial injections. To further reduce  
17 concentrations, four more rounds of injections  
18 were performed during October/November  
19 2002, September 2003, November/December  
20 2004, and January/March 2005. The injections  
21 and the decreasing VOC trends were  
22 documented in three Remedial Action Progress  
23 Reports in 2003, 2005, and 2010.

24 Long-term groundwater monitoring continued  
25 through July of 2011. PCE was successfully  
26 reduced to non-detectable levels through HRC  
27 and enhanced natural attenuation, and by 2008  
28 only benzene and vinyl chloride remained at  
29 concentrations exceeding the NJDEP GWQS in  
30 only one monitoring well (812MW04). The final  
31 detection of benzene exceeding the NJDEP  
32 GWQS was detected in October 2008. Vinyl  
33 chloride concentrations continued to decline, but  
34 still exceeded the NJDEP GWQS in 2011.

35 Groundwater sampling and analysis for VOCs  
36 was conducted annually from 2013 through  
37 2016. Metals were attributable to background  
38 concentrations and, with NJDEP concurrence,  
39 were removed from the sampling program after  
40 2013. VOCs were not detected in 2013;  
41 however, based on the historical VOC  
42 exceedances, annual groundwater monitoring  
43 for VOCs continued at 812MW04. The results of  
44 2015 and 2016 groundwater samples confirmed  
45 that VOCs had been reduced to concentrations  
46 less than the NJDEP GWQS. An NFA  
47 determination for groundwater (U.S. Army,  
48 2017b) was agreed to by NJDEP (2017a), and  
49 subsequently for all of FTMM-64 (NJDEP,  
50 2018).

## 51 **SCOPE AND ROLE OF** 52 **RESPONSE ACTION**

53 No further action is appropriate for sites FTMM-  
54 28, FTMM-54 (south of FTMM-18), FTMM-55,  
55 FTMM-56, FTMM-61, and FTMM-64.  
56 Unrestricted land use (as represented by  
57 NJDEP residential criteria) allows for full use  
58 without restrictions.

## 59 **SUMMARY OF SITE RISKS**

60 Any contaminants that were once identified as  
61 COCs for sites FTMM-28, FTMM-54 (south of  
62 FTMM-18), FTMM-55, FTMM-56, FTMM-61,  
63 and FTMM-64 have been evaluated and/or  
64 remediated and determined to no longer be  
65 COCs. Therefore, soil and groundwater (there is  
66 no potentially impacted surface water or  
67 sediment) do not pose an unacceptable risk to  
68 human health and the environment for current  
69 and future intended land use.

## 70 **SUMMARY OF PREFERRED** 71 **ALTERNATIVE**

72 Based on the results of multiple environmental  
73 investigations and reports, no remedial actions  
74 are required for sites FTMM-28, FTMM-54  
75 (south of FTMM-18), FTMM-55, FTMM-56,  
76 FTMM-61, and FTMM-64. Further investigation  
77 is not warranted for the following reasons: (1) the  
78 nature and extent of contaminants detected in  
79 soil and groundwater at the sites has been  
80 characterized; (2) no COCs posing risks to  
81 human health were ever identified at the sites, or  
82 if identified are no longer COCs either through  
83 remediation or natural degradation; and (3) no  
84 further investigation or action is recommended  
85 by the Army and agreed to by NJDEP.  
86 Therefore, NFA is required at sites FTMM-28,  
87 FTMM-54 (south of FTMM-18), FTMM-55,  
88 FTMM-56, FTMM-61, and FTMM-64 and  
89 unrestricted land use is appropriate for these  
90 sites.

## 91 **COMMUNITY PARTICIPATION**

92 Public participation is an important component of  
93 remedy selection. The Army is soliciting input  
94 from the community on the preferred "no further  
95 action" alternative identified for these sites. The  
96 comment period includes advertisement of this  
97 Proposed Plan and a public comment period.  
98 Written comments will be accepted during this

1 public comment period. The Army and the  
2 NJDEP encourage the public to gain a more  
3 comprehensive understanding of the sites and  
4 the remedial activities that have been conducted  
5 at the sites. The dates for the public comment  
6 period and the location of the Administrative  
7 Record files are provided on the front page of  
8 this Proposed Plan.

9 Comments made by the public will be addressed  
10 in a Responsiveness Summary. A copy of the  
11 Responsiveness Summary will be included in  
12 the Record of Decision and will be added to the  
13 FTMM Administrative Record file and  
14 information repositories.

7 U.S. Army, 2017d. Request for No Further Action Determination for Soil at the Portion of FTMM-54 Within  
8 the FTMM-18 Area, Fort Monmouth, New Jersey. May 18.

9 U.S. Army, 2018. Supplement to the Remedial Investigation Report for Site 812, FTMM-64, Fort  
10 Monmouth, Oceanport, New Jersey. June 6.

11 Versar, 2000. Underground Storage Tank Closure and Site Investigation Report, Building 283C, Main Post-  
12 West Area, NJDEP UST Registration No. 81533-229, DICAR No. 97-08-28-1330-33. October.

13 Versar, 2001a, Underground Storage Tank Closure and Site Investigation Report, Building 296, Main Post-  
14 West Area, NJDEP UST Registration No. 81533-213 thru 223, DICAR No. 93-11-02-1200-13, Fort  
15 Monmouth, New Jersey. May.

16 Versar, 2001b. Underground Storage Tank Closure and Site Investigation Report, Building 290B, Main  
17 Post-West Area, NJDEP UST Registration No. 81533-224 and 225, DICAR No. 93-11-30-1246-27.  
18 May.

19 Versar, 2001c. Remedial Investigation Report and Remedial Action Workplan, Site 812. June.

20 Versar, 2005a. Remedial Investigation Report Site 80/166 – Main Post. January 4.

21 Versar, 2005b, Remedial Investigation Report, CW-6 Former Pesticide Storage Building, U.S. Army  
22 Installation Fort Monmouth, Fort Monmouth, New Jersey. January 14.

23 Versar, 2005c. Remedial Investigation Report and Remedial Action Workplan, Site 283. October 28.

24 Weston, 1993. Underground Storage Tank Closure and Site Investigation Report, Building 290, NJDEP  
25 UST Registration No. 81533-193. October 28.

26 Weston. 1995. Final Site Investigation - Main Post and Charles Wood Areas, Fort Monmouth, New Jersey,  
27 December.

# 1 ACRONYMS AND ABBREVIATIONS

| ACRONYM  | DEFINITION                                                            |
|----------|-----------------------------------------------------------------------|
| µg/L     | microgram(s) per liter                                                |
| Army     | U.S. Army                                                             |
| bgs      | below ground surface                                                  |
| BRAC     | Base Realignment and Closure                                          |
| CERCLA   | Comprehensive Environmental Response, Compensation, and Liability Act |
| COC      | contaminant of concern                                                |
| CWA      | Charles Wood Area                                                     |
| DERP     | Defense Environmental Restoration Program                             |
| DoD      | Department of Defense                                                 |
| EA       | Evans Area                                                            |
| EPH      | extractable petroleum hydrocarbons                                    |
| FTMM     | Fort Monmouth                                                         |
| GWQS     | Ground Water Quality Standard(s)                                      |
| HRC      | Hydrogen Release Compound                                             |
| IGW      | impact to groundwater                                                 |
| MP       | Main Post                                                             |
| NCP      | National Oil and Hazardous Substances Pollution Contingency Plan      |
| NFA      | no further action                                                     |
| N.J.A.C. | New Jersey Administrative Code                                        |
| NJDEP    | New Jersey Department of Environmental Protection                     |
| NRDCSRs  | Non-Residential Direct Contact Soil Remediation Standard              |
| ORC      | Oxygen Release Compound                                               |
| PCB      | polychlorinated biphenyl                                              |
| PCE      | tetrachloroethene                                                     |
| POL      | Petroleum, Oil, and Lubricant                                         |

| ROD      | Record of Decision                                                    |
| SI       | Site Investigation                                                    |
| SL       | screening level                                                       |
| SVOC     | semivolatile organic compound                                         |
| TAL      | target analyte list                                                   |
| TIC      | tentatively identified compound                                       |
| TPH      | total petroleum hydrocarbons                                          |
| UST      | underground storage tank                                              |
| VI       | vapor intrusion                                                       |
| VOC      | volatile organic compound                                             |

2

# GLOSSARY OF TERMS

**Administrative Record** – A file that contains all information used by the lead agency to make its decision on the selection of a response action under CERCLA. A copy of this file is to be available for public review at or near the site, usually at the information repository.

**compliance averaging** – The average contaminant concentration in an area of concern may be used to determine compliance with remediation standards or soil cleanup criteria rather than the contaminant concentration of individual samples.

**Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA, otherwise known as Superfund)** – A federal law that addresses the funding for and remediation of abandoned or uncontrolled hazardous waste sites. This law also establishes criteria for the creation of key documents such as the Remedial Investigation, Proposed Plan, and Record of Decision.

**contaminant of concern (COC)** – A chemical that is present at sufficient concentrations to exceed NJDEP cleanup standards and so may pose a risk to human health or the environment.

**Defense Environmental Restoration Program (DERP)** - Under DERP, DoD conducts cleanup at active installations, Formerly Used Defense Sites, and BRAC locations. The Army manages the cleanup programs at their active installations and BRAC locations.

**ecological receptor** - a plant, animal, or habitat exposed to an adverse condition.

**extractable petroleum hydrocarbon (EPH)** – Collective fractions of hydrocarbon compounds. EPH is comprised of C9 through C18 Aliphatic Hydrocarbons, C19 through C36 Aliphatic Hydrocarbons, and C11 through C22 Aromatic Hydrocarbons.

**functional area** – A specified area used in compliance averaging. Usually 0.25 acres representing the size of a residential lot.

**groundwater** – Water found beneath the earth's surface that fills pores between materials such as sand, soil, or gravel. In aquifers, groundwater occurs in sufficient quantities that it may be used for drinking water, irrigation, and other purposes.

**Ground Water Quality Standards (GWQS)** – NJDEP GWQS, N.J.A.C 7:9C, establish the designated uses of the State's groundwater and specify the water quality (criteria) necessary to attain those designated uses. The ground water quality criteria are numerical values assigned to each constituent (pollutant) discharged to groundwater of the State. The GWQS also contain technical and general policies to ensure that the designated uses can be adequately protected. Groundwater is classified according to its hydrogeologic characteristics and designated uses.

**Hydrogen Release Compound (HRC®)** – A proprietary technology from Regenes Bioremediation Products, Inc. HRC is a chemical which, upon hydration, undergoes chemical reactions to ultimately generate hydrogen, which is used by microorganisms to degrade chlorinated compounds in groundwater.

**impact to groundwater (IGW)** – A NJDEP soil cleanup standard that is applied in soil above the groundwater table that is designed to be protective of groundwater quality.

**National Oil and Hazardous Substances Pollution Contingency Plan (NCP)** – National Oil and Hazardous Substances Pollution Contingency Plan, "National Contingency Plan" (40 CFR 300). Provides the organizational structure and procedures for preparing for and responding to discharges of oil and releases of hazardous substances, pollutants, and contaminants.

**New Jersey Administrative Code (N.J.A.C.)** – The collection of all rules and regulations made by the executive branch agencies of the State of New Jersey.

**no further action (NFA)** – the culmination of a property's environmental remediation, or determination of no need for environmental remediation.

**old field habitats** – Old field habitats include formerly mowed areas where the vegetation includes grasses, forbes and often immature trees. Old field habitats at the MP include grasses, many forbes

1 including Queen Ann's lace (*Daucus carota*), pokeweed (*Phytolacca americana*), goldenrod (*Solidago sp.*),  
2 milkweed (*Asclepias syriaca*), and sparse saplings of tree species including eastern red cedar (*Juniperus*  
3 *virginiana*) and winged sumac (*Rhus copallinum*).

4 **Oxygen Release Compound (ORC)** - A proprietary technology from Regenes Bioremediation Products,  
5 Inc. ORC Advanced® is an engineered, oxygen release compound designed specifically for enhanced  
6 bioremediation of petroleum hydrocarbons in groundwater and saturated soils.

7 **Petroleum, Oil, and Lubricant (POL)** – A broad term that includes all petroleum and associated products  
8 used by the Armed Forces.

9 **polychlorinated biphenyls (PCB)** – A group of persistent chemicals used in transformers and capacitors  
10 for insulating purposes and in gas pipeline systems as a lubricant.

11 **potable water** – Water of a quality suitable for drinking.

12 **Proposed Plan** – A plan that identifies the preferred remedial alternative(s) for a site, and is made available  
13 to the public for comment.

14 **Record of Decision (ROD)** - A public document that explains which cleanup alternative(s) will be used at  
15 a site.

16 **Remedial Action Workplan (RAWP)** – A work plan that includes a site summary, a summary of cleanup  
17 goals, and information required for the implementation of remedial action.

18 **Remedial Investigation (RI)** – Exploratory inspection conducted at a site to define the nature and extent  
19 of contamination present, and to assess potential related hazards and risks.

20 **Responsiveness Summary** – A component of the Record of Decision that summarizes information about  
21 the comments and views of the public and support agency regarding both the remedial alternatives and  
22 general concerns about the site submitted during the public comment period. It also documents in the  
23 record how public comments were integrated into the decision-making process.

24 **riparian** – Riparian areas are ecosystems adjacent to a river or waterway that, in an undisturbed state,  
25 provide habitat for wildlife and help improve water quality. Riparian areas are usually transitional zones  
26 between wetland and upland areas and are generally comprised of grasses, shrubs, trees, or a mix of  
27 vegetation types that exist within a variety of landscapes (e.g., natural, agricultural, forested, suburban,  
28 and urban).

29 **semivolatile organic compounds (SVOC)** – An organic compound which has a boiling point higher than  
30 water and which may vaporize when exposed to temperatures above room temperature.

31 **Site Investigation (SI)** - Exploratory inspection conducted at a site to determine absence or presence of  
32 contamination.

33 **target analyte list (TAL) Metals** - A list of 23 inorganic target analytes: aluminum, antimony, arsenic,  
34 barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese,  
35 mercury, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc.

36 **tentatively identified compound (TIC)** – A compound that can be seen by the analytical testing method,  
37 but its identity and concentration cannot be confirmed without further analytical investigation.

38 **total petroleum hydrocarbons (TPH)** - a large family of several hundred chemical compounds that  
39 originally come from crude oil. Crude oil is used to make petroleum products. Because there are so many  
40 different chemicals in crude oil and in other petroleum products, it is not practical to measure each one  
41 separately. However, it is useful to measure the total amount of TPH at a site

42 **vapor intrusion (VI)** – The migration of released volatile chemicals from the subsurface into overlying  
43 buildings.

44 **volatile organic compound (VOC)** – Organic chemical compound whose composition makes it possible  
45 for it to evaporate under normal indoor atmospheric conditions of temperature and pressure.

1   **USE THIS SPACE TO WRITE YOUR COMMENTS**

2   Your input on the Proposed Plan for FTMM-28, FTMM-54 (south of FTMM-18), FTMM-55, FTMM-56, FTMM-61, and  
3   FTMM-64 is important to the Army. Comments provided by the public are valuable in helping the Army select a  
4   remedy for these sites.

5   You may use the space below to write your comments. Comments must be postmarked by September 21, 2020.  
6   Mailed comments should be sent to Mr. William Colvin at the address listed on Page 1. Comments may also be  
7   emailed to Mr. Colvin by September 21, 2020 via the following e-mail address:  
8   [william.r.colvin18.civ@mail.mil](mailto:william.r.colvin18.civ@mail.mil). If you have any questions about the comment period, please contact Mr. Colvin at:  
9   [william.r.colvin18.civ@mail.mil](mailto:william.r.colvin18.civ@mail.mil).
